

Package ‘terra’

March 9, 2021

Type Package

Title Spatial Data Analysis

Version 1.1-4

Date 2021-02-28

Depends R (>= 3.5.0)

Suggests parallel, tinytest, ncdf4

LinkingTo Rcpp

Imports methods, Rcpp, raster (>= 3.3-7)

SystemRequirements C++11, GDAL (>= 3.0.4), GEOS (>= 3.8.0), PROJ (>= 6.3.1)

Maintainer Robert J. Hijmans <r.hijmans@gmail.com>

Description Methods for spatial data analysis, especially raster data. Methods allow for low-level data manipulation as well as high-level global, local, zonal, and focal computation. The predict and interpolate methods facilitate the use of regression type (interpolation, machine learning) models for spatial prediction. Processing of very large files is supported. See the manual and tutorials on <<https://rspatial.org/terra/>> to get started. 'terra' is very similar to the 'raster' package; but 'terra' is simpler, better, and faster.

License GPL (>= 3)

terra-package	<i>The terra package</i>
---------------	--------------------------

Description

terra provides methods to manipulate geographic (spatial) data in "raster" and "vector" form. Raster data divide space into rectangular cells (pixels) and they are commonly used to represent spatially continuous phenomena, such as elevation or the weather. Satellite images also have this data structure. In contrast, "vector" spatial data (points, lines, polygons) are typically used to represent discrete spatial entities, such as a road, country, or bus stop.

The package implements two main classes (R data types): `SpatRaster` and `SpatVector`. `SpatRaster` supports handling large raster files that cannot be loaded into memory; local, focal, zonal, and global raster operations; polygon, line and point to raster conversion; integration with modeling methods to make spatial predictions; and more. `SpatVector` supports all types of geometric operations such as intersections.

Additional classes include `SpatExtent`, which is used to define a spatial extent (bounding box); `SpatRasterDataset` to represents a collection of sub-datasets for the same area. Each sub-dataset is a `SpatRaster` with possibly many layers, and may, for example, represent different weather variables; and `SpatRasterCollection` and `SpatVectorCollection` that are vectors of `SpatRaster` or `SpatVector`.

The classes used wrap a C++ pointer that holds pr points to the data, and almost all data manipulation is done in C++ (for better speed). These objects cannot be directly saved to a ".Rds" file or used in cluster computing. They cannot be recovered from a saved R session either. See [pack](#) or [writeRaster](#) to work around that limitation.

The terra package is conceived as a replacement of the raster package. terra has a very similar, but simpler, interface, and it is faster than raster. At the bottom of this page there is a table that shows differences in the methods between the two packages.

Below is a list of some of the most important methods grouped by theme. Some of these may not have been implemented yet (they are not hyperlinked).

SpatRaster

I. Creating, combining and sub-setting SpatRaster objects

<code>rast</code>	Create a <code>SpatRaster</code> from scratch, file, or another object
<code>c</code>	Combine <code>SpatRasters</code> (multiple layers)
<code>add<-</code>	Add a <code>SpatRaster</code> to another one
<code>subset</code> or <code>[]</code> , or <code>\$</code>	Select layers of a <code>SpatRaster</code>
<code>selectRange</code>	Select cell values from different layers using an index layer

II. Changing the spatial extent and/or resolution of a `SpatRaster`

Also see the methods in section VIII

<code>merge</code>	Combine <code>SpatRasters</code> with different extents (but same origin and resolution)
<code>mosaic</code>	Combine <code>SpatRasters</code> with different extents and a function for the values in overlapping areas
<code>crop</code>	Select a geographic subset of a <code>SpatRaster</code>
<code>expand</code>	Enlarge a <code>SpatRaster</code>
<code>trim</code>	Trim a <code>SpatRaster</code> by removing exterior rows and/or columns that only have NAs
<code>aggregate</code>	Combine cells of a <code>SpatRaster</code> to create larger cells
<code>disaggregate</code>	Subdivide cells
<code>resample</code>	Resample (warp) values to a <code>SpatRaster</code> with a different origin and/or resolution
<code>project</code>	Project (warp) values to a <code>SpatRaster</code> with a different coordinate reference system
<code>shift</code>	Adjust the location of <code>SpatRaster</code>
<code>flip</code>	Flip values horizontally or vertically
<code>rotate</code>	Rotate values around the date-line (for lon/lat data)
<code>t</code>	Transpose a <code>SpatRaster</code>

III. Local (cell based) computation

<code>app</code>	Apply a function to cells, across layers (as in <code>base::apply</code>)
<code>tapp</code>	Apply a function to groups of layers (as in <code>base::tapply</code>)
<code>lapp</code>	Apply a function using the layers as variables
<code>rapp</code>	Apply a function to a spatially variable range of layers
<code>arith</code>	Use a function to compute new values for all cells
<code>Arith-methods</code>	Standard arithmetic methods (+, -, *, ^, %, %/, /)
<code>Math-methods</code>	Math methods like <code>abs</code> , <code>sqrt</code> , <code>trunc</code> , <code>log</code> , <code>log10</code> , <code>exp</code> , <code>sin</code> , <code>round</code>
<code>Logic-methods</code>	Boolean methods (!, &,)
<code>Summary-methods</code>	Summary methods (<code>mean</code> , <code>max</code> , <code>min</code> , <code>median</code> , <code>sum</code> , <code>range</code> , <code>prod</code> , <code>any</code> , <code>all</code> , <code>stdev</code> , <code>which.min</code> ,
<code>Compare-methods</code>	Comparison methods (<code>==</code> , <code>!=</code> , <code>></code> , <code><</code> , <code><=</code> , <code>>=</code>)
<code>area</code>	Compute the area of cells
<code>classify</code>	(Re-)classify values
<code>cover</code>	First layer covers second layer except where the first layer is NA
<code>init</code>	Initialize cells with new values
<code>mask</code>	Use values from first <code>SpatRaster</code> except where cells of the mask <code>SpatRaster</code> are NA (or another value)

IV. Zonal and global computation

<code>area</code>	Compute the total area covered by cells
<code>crosstab</code>	Cross-tabulate two SpatRasters
<code>freq</code>	Frequency table of SpatRaster cell values
<code>global</code>	Summarize SpatRaster cell values with a function
<code>quantile</code>	Quantiles
<code>stretch</code>	Stretch values
<code>scale</code>	Scale values
<code>summary</code>	Summary of the values of a SpatRaster (quantiles and mean)
<code>unique</code>	Get the unique values in a SpatRaster
<code>zonal</code>	Summarize a SpatRaster by zones in another SpatRaster

V. Focal and other spatial contextual computation

<code>focal</code>	Focal (neighborhood; moving window) functions
<code>adjacent</code>	Identify cells that are adjacent to a set of cells of a SpatRaster
<code>boundaries</code>	Detection of boundaries (edges)
<code>distance</code>	Shortest distance to a cell that is not NA or to or from a vector object
<code>direction</code>	Direction (azimuth) to or from cells that are not NA
<code>localFun</code>	Local association (using neighborhoods) functions
<code>patches</code>	Find patches
<code>terrain</code>	Compute slope, aspect and other terrain characteristics from elevation data
<code>autocor</code>	Compute global or local spatial autocorrelation

VI. Model predictions

<code>predict</code>	Predict a non-spatial model to a SpatRaster
<code>interpolate</code>	Predict a spatial model to a SpatRaster

VII. Accessing cell values

Apart from the function listed below, you can also use indexing with `[]` with cell numbers, and row and/or column numbers

<code>values</code>	Get or set all cell values (fails with very large rasters)
<code>setValues</code>	Set new values to the cells of a <code>SpatRaster</code>
<code>as.matrix</code>	Get cell values as a matrix
<code>as.array</code>	Get cell values as an array
<code>extract</code>	Extract cell values from a <code>SpatRaster</code> (e.g., by cell, coordinates, polygon)
<code>spatSample</code>	Regular or random sample
<code>minmax</code>	Get the minimum and maximum value of the cells of a <code>SpatRaster</code> (if known)
<code>setMinMax</code>	Compute the minimum and maximum value of a <code>SpatRaster</code> if these are not known
<code>extract</code>	spatial queries of a <code>SpatRaster</code> with a <code>SpatVector</code>

VIII. Getting and setting `SpatRaster` dimensions

Get or set basic parameters of `SpatRasters`. If there are values associated with a `SpatRaster` object (either in memory or via a link to a file) these are lost when you change the number of columns or rows or the resolution. This is not the case when the extent is changed (as the number of columns and rows will not be affected). Similarly, with `crs` you can set the coordinate reference system, but this does not transform the data (see [project](#) for that).

<code>ncol</code>	The number of columns
<code>nrow</code>	The number of rows
<code>ncell</code>	The number of cells (can not be set directly, only via <code>ncol</code> or <code>nrow</code>)
<code>res</code>	The resolution (x and y)
<code>nlyr</code>	Get or set the number of layers
<code>names</code>	Get or set the layer names
<code>xres</code>	The x resolution (can be set with <code>res</code>)
<code>yres</code>	The y resolution (can be set with <code>res</code>)
<code>xmin</code>	The minimum x coordinate (or longitude)
<code>xmax</code>	The maximum x coordinate (or longitude)
<code>ymin</code>	The minimum y coordinate (or latitude)
<code>ymax</code>	The maximum y coordinate (or latitude)
<code>ext</code>	Get or set the extent (minimum and maximum x and y coordinates (a.k.a. "bounding box"))
<code>origin</code>	The origin of a <code>SpatRaster</code>
<code>crs</code>	The coordinate reference system (map projection)
<code>is.lonlat</code>	Test if an object has (or may have) a longitude/latitude coordinate reference system; and if it has glob
<code>sources</code>	Get the filename(s) to which a <code>SpatRaster</code> is linked
<code>compareGeom</code>	Compare the geometry of <code>SpatRasters</code>
<code>NAflag</code>	Set the NA value (for reading from a file with insufficient metadata)

IX. Computing row, column, cell numbers and coordinates

Cell numbers start at 1 in the upper-left corner. They increase within rows, from left to right, and then row by row from top to bottom. Likewise, row numbers start at 1 at the top of the raster, and column numbers start at 1 at the left side of the raster.

xFromCol	x-coordinates from column numbers
yFromRow	y-coordinates from row numbers
xFromCell	x-coordinates from row numbers
yFromCell	y-coordinates from cell numbers
xyFromCell	x and y coordinates from cell numbers
colFromX	Column numbers from x-coordinates (or longitude)
rowFromY	Row numbers from y-coordinates (or latitude)
rowColFromCell	Row and column numbers from cell numbers
cellFromXY	Cell numbers from x and y coordinates
cellFromRowCol	Cell numbers from row and column numbers
cellFromRowColCombine	Cell numbers from all combinations of row and column numbers
cells	Cell numbers from an SpatVector or SpatExtent

X. Writing SpatRaster files

Basic	
writeRaster	Write all values of SpatRaster to disk
.	
writeCDF	Write netCDF files
.	
Advanced	
blockSize	Get suggested block size for reading and writing
writeStart	Open a file for writing
writeValues	Write some values
writeStop	Close the file after writing

XI. Miscellaneous SpatRaster methods

terraOptions	Show, set, save or get session options
sources	Show the data sources of a SpatRaster
tmpFiles	Show or remove temporary files
canProcessInMemory	Test whether a file can be created in memory
readStart	Open file connections for efficient multi-chunck reading
readStop	Close file connections
inMemory	Are the cell values in memory?
fromDisk	Are the cell values read from a file?

SpatRasterDataSet

XII. SpatRasterDataset

A SpatRasterDataset contains SpatRaster objects that are sub-datasets for the same area. They all have the same extent and resolution.

<code>sds</code>	Create a SpatRasterDataset
<code>[</code> or <code>\$</code>	Extract a SpatRaster
<code>names</code>	Get the names of the sub-datasets

SpatVector

XIII. Create and combine SpatVector objects

<code>vect</code>	Create a SpatRaster from a file (e.g. shapefile) or from another object
<code>c</code>	append SpatVectors of the same geometry type ("rbind")
<code>unique</code>	remove duplicates
<code>project</code>	Project a SpatVector to a different coordinate reference system
<code>writeVector</code>	Write SpatVector data to disk
<code>centroids</code>	Get the centroids of a SpatVector
<code>voronoi</code>	Voronoi diagram
<code>delauy</code>	Delauny triangles
<code>convexhull</code>	Compute the convex hull of a SpatVector
<code>fill</code>	Remove or extract holes from polygons

XIV. Properties of SpatVector objects

<code>geom</code>	returns the geometries as matrix or WKT
<code>linearUnits</code>	returns the linear units of the crs (in meter)
<code>ncol</code>	The number of columns (of the attributes)
<code>nrow</code>	The number of rows (of the geometries and attributes)
<code>names</code>	Get or set the layer names
<code>ext</code>	Get the extent (minimum and maximum x and y coordinates (a.k.a. "bounding box"))
<code>crs</code>	The coordinate reference system (map projection)
<code>is.lonlat</code>	Test if an object has (or may have) a longitude/latitude coordinate reference system; and if it has glob

XV. Geometric queries

<code>relate</code>	geometric relationships such as "intersects", "overlaps", and "touches"
<code>adjacent</code>	find adjacent polygons
<code>near</code>	find nearby geometries
<code>area</code>	computes the area covered by polygons
<code>perimeter</code>	computes the length of the perimeter of polygons, and the length of lines

XVI. Geometric operations

<code>erase</code> or "-"	erase (parts of) geometries
<code>intersect</code> or "*"	intersect geometries
<code>union</code> or "+"	Merge geometries
<code>cover</code>	update polygons
<code>symdif</code>	symmetrical difference of two polygons
<code>aggregate</code>	dissolve smaller polygons into larger ones
<code>buffer</code>	buffer geometries
<code>disaggregate</code>	split multi-geometries into separate geometries
<code>crop</code>	clip geometries using a rectangle (SpatExtent) or SpatVector

XVII. SpatVector attributes

<code>extract</code>	spatial queries between SpatVector and SpatVector (e.g. point in polygons)
<code>select</code>	select - interactively select geometries
<code>click</code>	identify attributes by clicking on a map

<code>merge</code>	Join a table with a SpatVector
<code>as.data.frame</code>	get attributes as a data.frame

XVIII. Change geometries (for display, experimentation)

<code>shift</code>	change the position geometries
<code>spin</code>	rotate geometries around an origin
<code>rescale</code>	shrink (or expand) geometries, for example to make an inset map
<code>flip</code>	flip geometries vertically or horizontally
<code>t</code>	transpose geometries (switch x and y)

Spat* Collections

XIX. Collections

A SpatRasterCollection is a vector of SpatRaster objects. Unlike for a SpatRasterDataset, there the extent and resolution of the elements do not need to match each other. A SpatVectorCollection is a vector of SpatVector objects.

<code>svc</code>	create a SpatRasterCollection
<code>length</code>	how many elements does the collection have?
<code>[</code>	extract an element

SpatExtent

XX. SpatExtent

<code>extent</code>	Create a SpatExtent object
<code>intersect</code>	Intersect two SpatExtent objects, same as -
<code>union</code>	Combine two SpatExtent objects, same as +

Math-methods	round/floor/ceiling of a SpatExtent
<code>align</code>	Align a SpatExtent with a SpatRaster
<code>draw</code>	Create a SpatExtent by drawing it on top of a map (plot)

General methods

XXI. Data type conversion

You can coerce SpatRasters to Raster* objects after loading the raster package with `as(object, "Raster")`, or `raster(object)` or `brick(object)` or `stack(object)`

<code>rast</code>	SpatRaster from matrix and other objects
<code>rasterize</code>	Rasterizing points, lines or polygons
<code>as.points</code>	Create points from a SpatRaster or SpatVector
<code>as.lines</code>	Create points from a SpatRaster or SpatVector
<code>as.polygons</code>	Create polygons from a SpatRaster
<code>as.contour</code>	Contour lines from a SpatRaster

XXII. Plotting

Maps

<code>plot</code>	Plot a SpatRaster or SpatVector. The main method to create a map
<code>points</code>	Add points to a map
<code>lines</code>	Add lines to a map
<code>polys</code>	Add polygons to a map
<code>plotRGB</code>	Combine three layers (red, green, blue channels) into a single "real color" image
<code>dots</code>	Make a dot-density map
<code>cartogram</code>	Make a cartogram
<code>image</code>	Alternative way to plot a SpatRaster
<code>persp</code>	Perspective plot of a SpatRaster
<code>contour</code>	Contour plot or filled-contour plot of a SpatRaster
<code>text</code>	Plot the values of a SpatRaster or SpatVector on top of a map
<code>inset</code>	Add a small inset (overview) map
<code>sbar</code>	Add a scalebar

.

Interacting with a map

<code>zoom</code>	Zoom in to a part of a map
<code>click</code>	Query values of SpatRaster or SpatVector by clicking on a map
<code>select</code>	Select a spatial subset of a SpatRaster or SpatVector

draw	Create a SpatExtent or SpatVector by drawing on a map
.	
Other plots	
plot	x-y scatter plot of the values of two SpatRaster objects
hist	Histogram of SpatRaster values
barplot	Barplot of a SpatRaster
density	Density plot of SpatRaster values
pairs	Pairs plot for layers in a SpatRaster
boxplot	Box plot of the values of a SpatRaster

XXIII. Comparison with the raster package

terra has a single class SpatRaster for which raster has three (RasterLayer, RasterStack, RasterBrick). Likewise there is a single class for vector data SpatVector that replaces six Spatial* classes. Most method names are the same, but note the following important differences in methods names with the 'raster' package

raster package	terra package
raster, brick, stack	rast
rasterFromXYZ	rast(, type="xyz")
stack, addLayer (combining Raster* objects or files)	c
addLayer	add<-
extent	ext
calc	app and arith
overlay	lapp
stackApply	tapp
extend	expand
nlayers	nlyr
NAvalue	NAflag
stackSelect	selectRange
reclassify, subs, cut	classify
cellStats	global
projectRaster	project
dropLayer	subset
isLonLat, isGlobalLonLat, couldBeLonLat	is.lonlat
shapefile	vect
gridDistance, distanceFromPoints	distance
drawExtent, drawPoly, drawLine	draw
compareRaster	compareGeom
sampleRandom, sampleRegular	spatSample
rasterToPoints	as.points
rasterToPolygons	as.polygons
cellFromLine, cellFromPolygon, cellsFromExtent	cells
layerize	separate
clump	patches

Also note that even if function names are the same in terra and raster, their output can be different. In most cases to get more consistency in the returned values (and thus fewer errors in the downstream code that uses them). In other cases it simply seemed better. Here are some examples:

<code>area</code>	By default, terra returns the summed area of the raster cells that are not NA. raster returns a RasterLayer
-	
<code>as.polygons</code>	By default, terra returns dissolved polygons
-	
<code>extract</code>	By default, terra returns a matrix, with the first column the sequential ID of the vectors. raster returns a RasterLayer
-	
<code>values</code>	terra always returns a matrix. raster returns a vector for a RasterLayer
-	
<code>Summary-methods</code>	With raster, <code>mean(x, y)</code> and <code>mean(stack(x, y))</code> return the same result, a single layer with the mean of the layers

Acknowledgments

This package is an attempt to climb on the shoulders of giants (GDAL, PROJ, GEOS, NCDF, GeographicLib, Rcpp, R). Many people have contributed by asking questions or [filing bug reports](#). The feedback and suggestions by Kendon Bell, Jean-Luc Dupouey, Gerald Nelson, and Michael Sumner have been especially helpful.

Author(s)

Except where indicated otherwise, the methods and functions in this package were written by Robert Hijmans. The configuration scripts were written by Roger Bivand. Some of the underlying C++ code for GDAL/GEOS was adapted from code written by Edzer Pebesma for `sf`. The progress bar code is by Karl Forner (RcppProgress). Jeroen Ooms provided the compiled GDAL and GEOS libraries for installation on windows

`add` *Add (in place) a SpatRaster to another SpatRaster object*

Description

Add (in place) a SpatRaster to another SpatRaster object. Comparable with `c`, but without copying the object.

Usage

```
## S4 replacement method for signature 'SpatRaster,SpatRaster'
add(x)<-value
```

Arguments

x	SpatRaster
value	SpatRaster

Value

SpatRaster

See Also[c](#)**Examples**

```
r <- rast(nrow=5, ncol=9, vals=1:45)
x <- c(r, r*2)
add(x) <- r*3
x
```

adjacent

*Adjacent cells***Description**

Identify cells that are adjacent to a set of raster cells. Or identify adjacent polygons

Usage

```
## S4 method for signature 'SpatRaster'
adjacent(x, cells, directions="rook", include=FALSE)

## S4 method for signature 'SpatVector'
adjacent(x, type="rook", pairs=TRUE, symmetrical=FALSE )
```

Arguments

x	SpatRaster
cells	vector of cell numbers for which adjacent cells should be found. Cell numbers start with 1 in the upper-left corner and increase from left to right and from top to bottom
directions	the directions in which cells should be connected: "rook" (4 directions), "queen" (8 directions), "16" (knight and one-cell queen moves), or "bishop" to connect cells with one-cell diagonal moves.
include	logical. Should the focal cells be included in the result?
type	character. One of "rook", "queen", "touches", or "intersects". "queen" and "touches" are synonyms. "rook" exclude polygons that touch at a single node only. "intersects" includes polygons that touch or overlap

`pairs` logical. If TRUE a "from", "to" matrix is returned

`symmetrical` logical. If TRUE, an adjacent pair is only included once. For example, if polygon 1 is adjacent to polygon 3, the implied adjacency between 3 and 1 is not reported

Value

matrix

See Also

[relate](#), [near](#)

Examples

```
r <- rast(nrows=10, ncols=10)
adjacent(r, cells=c(1, 5, 55), directions="queen")
r <- rast(nrows=10, ncols=10, crs="+proj=utm +zone=1 +datum=WGS84")
adjacent(r, cells=11, directions="rook")
# global lat/lon wraps around
r <- rast(nrows=10, ncols=10, crs="+proj=longlat +datum=WGS84")
adjacent(r, cells=11, directions="rook")

f <- system.file("ex/lux.shp", package="terra")
v <- vect(f)
a <- adjacent(v, symmetrical=TRUE)
head(a)
```

aggregate

Aggregate raster or vector data

Description

Aggregate a `SpatRaster` to create a new `SpatRaster` with a lower resolution (larger cells). Aggregation groups rectangular areas to create larger cells. The value for the resulting cells is computed with a user-specified function.

Or aggregate ("dissolve") a `SpatVector`.

Usage

```
## S4 method for signature 'SpatRaster'
aggregate(x, fact=2, fun="mean", ..., cores=1, filename="", overwrite=FALSE, wopt=list())

## S4 method for signature 'SpatVector'
aggregate(x, by=NULL, dissolve=TRUE, fun="mean", ...)
```

Arguments

<code>x</code>	SpatRaster
<code>fact</code>	positive integer. Aggregation factor expressed as number of cells in each direction (horizontally and vertically). Or two integers (horizontal and vertical aggregation factor) or three integers (when also aggregating over layers)
<code>fun</code>	function used to aggregate values. Either an actual function, or for the following, their name: "mean", "max", "min", "median", "sum" and "modal"
<code>...</code>	additional arguments passed to <code>fun</code> , such as <code>na.rm=TRUE</code>
<code>cores</code>	positive integer. If <code>cores > 1</code> , a 'parallel' package cluster with that many cores is created. Ignored for C++ level implemented functions "mean", "max", "min", "median", "sum" and "modal"
<code>filename</code>	character. Output filename
<code>overwrite</code>	logical. If TRUE, <code>filename</code> is overwritten
<code>wopt</code>	list with named options for writing files as in <code>writeRaster</code>
<code>by</code>	character. The variable used to aggregate the geometries
<code>dissolve</code>	logical. Should borders between aggregated geometries be dissolved?

Details

Aggregation starts at the upper-left end of a SpatRaster. If a division of the number of columns or rows with `factor` does not return an integer, the extent of the resulting SpatRaster will be somewhat larger than that of the original SpatRaster. For example, if an input SpatRaster has 100 columns, and `fact=12`, the output SpatRaster will have 9 columns and the maximum x coordinate of the output SpatRaster is also adjusted.

The function `fun` should take multiple numbers, and return a single number. For example `mean`, `modal`, `min` or `max`.

It should also accept a `na.rm` argument (or ignore it as one of the 'dots' arguments).

Value

SpatRaster

See Also

[disaggregate](#)

Examples

```
r <- rast()
# aggregated SpatRaster, no values
ra <- aggregate(r, fact=10)

values(r) <- runif(ncell(r))
# aggregated raster, max of the values
ra <- aggregate(r, fact=10, fun=max)
```

```

# multiple layers
s <- c(r, r*2)
x <- aggregate(s, 2)

## SpatVector
f <- system.file("ex/lux.shp", package="terra")
v <- vect(f)
va <- aggregate(v, "ID_1")

plot(va, "NAME_1", lwd=5, plg=list(x="topright"), mar=rep(2,4))
lines(v, lwd=3, col="light gray")
lines(va)
text(v, "ID_1", halo=TRUE)

```

align

Align a SpatExtent

Description

Align an SpatExtent with a SpatRaster This can be useful to create a new SpatRaster with the same origin and resolution as an existing SpatRaster. Do not use this to force data to match that really does not match (use e.g. [resample](#) or (dis)aggregate for this).

It is also possible to align a SpatExtent to a clean divisor.

Usage

```

## S4 method for signature 'SpatExtent,SpatRaster'
align(x, y, snap="near")

## S4 method for signature 'SpatExtent,numeric'
align(x, y)

```

Arguments

x	SpatExtent
y	SpatRaster or numeric
snap	Character. One of "near", "in", or "out", to determine in which direction the extent should be aligned. To the nearest border, inwards or outwards

Value

SpatExtent

See Also

[ext](#), [draw](#)

Examples

```

r <- rast()
e <- ext(-10.1, 9.9, -20.1, 19.9)
ea <- align(e, r)
e
ext(r)
ea

align(e, 0.5)

```

animate

*Animate a SpatRaster***Description**

Animate (sequentially plot) the layers of a SpatRaster to create a movie

Usage

```

## S4 method for signature 'SpatRaster'
animate(x, pause=0.25, main, range, maxcell=50000, n=1, ...)

```

Arguments

x	SpatRaster
pause	numeric. How long should be the pause be between layers?
main	title for each layer. If not supplied the z-value is used if available. Otherwise the names are used.
range	numeric vector of length 2. Range of values to plot
maxcell	integer > 0. Maximum number of cells to use for the plot. If maxcell < ncell(x), spatSample(type="regular") is used before plotting
n	integer > 0. Number of loops
...	Additional arguments passed to plot

Value

None

See Also

[plot](#)

Examples

```

s <- rast(system.file("ex/logo.tif", package="terra"))
animate(s, n=1)

```

app

Apply a function to the cells of a SpatRaster

Description

Apply a function to values of each cell of a SpatRaster. Similar to [apply](#) – think of each layer in a SpatRaster as a column (or row) in a matrix. This is generally used to summarize the values of multiple layers into one layer; but this is not required.

You can also apply a function fun across datasets by layer of a SpatRasterDataset. In that case, summarization is across SpatRasters, not across layers.

Usage

```
## S4 method for signature 'SpatRaster'
app(x, fun, ..., cores=1, filename="", overwrite=FALSE, wopt=list())

## S4 method for signature 'SpatRasterDataset'
app(x, fun, ..., cores=1, filename="", overwrite=FALSE, wopt=list())
```

Arguments

x	SpatRaster or SpatRasterDataset
fun	function
...	additional arguments for fun
cores	positive integer. If cores > 1, a 'parallel' package cluster with that many cores is created and used. Ignored for C++ level implemented functions "max", "min", "mean", "range", "prod", "sum", "any", and "all"
filename	character. Output filename
overwrite	logical. If TRUE, filename is overwritten
wopt	list with named options for writing files as in writeRaster

Details

To speed things up, parallelization is supported, but this is often not helpful, and it may actually be slower. There is only a speed gain if you have many cores (> 8) and/or a very complex (slow) function fun. If you write fun yourself, consider supplying a `cppFunction` made with the `Rcpp` package instead (or go have a cup of tea while the computer works for you).

Value

SpatRaster

See Also

[lapp](#), [tapp](#), [math](#)

Examples

```

r <- rast(ncols=10, nrows=10)
values(r) <- 1:ncell(r)
x <- c(r, sqrt(r), r-50)
s <- app(x, fun=sum)
s
# for a few generic functions like
# "sum", "mean", and "max" you can also do
sum(x)

## SpatRasterDataset
sd <- sds(x, x*2, x/3)
a <- app(sd, max)
a
# same as
max(x, x*2, x/3)

```

area

Area and perimeter

Description

Compute the area of polygons or for raster cells that are not NA. Computing the surface area of raster cells is particularly relevant for longitude/latitude rasters, as the size of the cells is constant in degrees, but not in meters. But it can also be very important with raster data if the coordinate reference system is not equal-area. In that case, you can use the `correct=TRUE` option.

For vector data, the best way to compute area is to use the longitude/latitude crs if that is what the data come in. This is contrary to (erroneous) popular belief that suggest that you should use a planar crs.

The perimeter method works only on `SpatVector` objects, and computes the length of lines or the perimeter of polygons.

Usage

```

## S4 method for signature 'SpatRaster'
area(x, sum=TRUE, correct=FALSE, filename="", ...)

## S4 method for signature 'SpatVector'
area(x)

## S4 method for signature 'SpatVector'
perimeter(x)

```

Arguments

x	SpatRaster or SpatVector
sum	logical. If TRUE the summed area of the cells that are not NA is returned. Otherwise, a SpatRaster with the area for each cell is returned
correct	logical. If TRUE, the area is not computed based on the linear units of the coordinate reference system, but on the <i>*actual*</i> area, correcting for distortion. This may be considerably slower. Only relevant for planar coordinate references, not for lon/lat data
filename	character. Output filename
...	additional arguments for writing files as in writeRaster

Value

area or perimeter in m2

Examples

```
### SpatRaster
r <- rast(nrow=18, ncol=36)
v <- 1:ncell(r)
v[200:400] <- NA
values(r) <- v

# area for each raster cell
a <- area(r, sum=FALSE)

# summed area in km2
area(r) / 1000000

## you can use mask to remove the cells in r that are NA
## and compute the global sum to get the same result
am <- mask(a, r)
global(am, "sum", na.rm=TRUE) / 1000000

# effect of "correct" (commented out as this does not work with old GDAL)
#r <- rast(ncol=90, nrow=45, ymin=-80, ymax=80)
#m <- project(r, "+proj=merc")

#a <- area(m, sum=FALSE, wopt=list(names="naive"))
#b <- area(m, correct=TRUE, sum=FALSE, names="corrected")
#plot(c(a, b)/1000000, nc=1)

### SpatVector
f <- system.file("ex/lux.shp", package="terra")
v <- vect(f)
a <- area(v)
a
sum(a)
```

```
perimeter(v)
```

arith	<i>apply a local function</i>
-------	-------------------------------

Description

Apply a function that (arithmetically) operates to individual cells and layers of a `SpatRaster`, to return the same number of layers as in the input `SpatRaster`. That, is unlike with `app`, without summarizing over layers.

Usage

```
## S4 method for signature 'SpatRaster'  
arith(x, fun, ..., filename="", overwrite=FALSE, wopt=list())
```

Arguments

x	<code>SpatRaster</code>
fun	function
...	additional arguments for fun
filename	character. Output filename
overwrite	logical. If TRUE, filename is overwritten
wopt	list with named options for writing files as in <code>writeRaster</code>

Value

`SpatRaster`

See Also

[arith](#)

Examples

```
r <- rast(ncols=10, nrows=10)  
values(r) <- 1:ncell(r)  
  
x <- arith(r, sqrt)  
  
# equivalent to  
y <- sqrt(x)
```

as.character	<i>Create a text representation of (the skeleton of) an object</i>
--------------	--

Description

Create a text representation of (the skeleton of) an object

Usage

```
## S4 method for signature 'SpatExtent'  
as.character(x)  
  
## S4 method for signature 'SpatRaster'  
as.character(x)
```

Arguments

x SpatRaster

Value

character

Examples

```
r <- rast()  
ext(r)  
ext(c(0, 20, 0, 20))
```

as.data.frame	<i>SpatRaster or SpatVector to data.frame</i>
---------------	---

Description

Coerce a SpatRaster or SpatVector into a data.frame or a SpatVector into list

Usage

```
## S4 method for signature 'SpatVector'  
as.data.frame(x, geom=FALSE)  
  
## S4 method for signature 'SpatRaster'  
as.data.frame(x, xy=FALSE, cells=FALSE, na.rm=TRUE)  
  
## S4 method for signature 'SpatVector'  
as.list(x, geom=FALSE)
```

Arguments

x	SpatVector
geom	logical. If TRUE the WKT geometry is included
xy	logical. If TRUE, the coordinates of each raster cell are included
cells	logical. If TRUE, the cell numbers of each raster cell are included
na.rm	logical. If TRUE, cells that have a NA value in at least one layer are removed

Value

data.frame

See Also

see [coerce](#) for as.data.frame with a SpatRaster; and [geom](#) to only extract the geometry of a SpatVector

Examples

```
f <- system.file("ex/lux.shp", package="terra")
v <- vect(f)
as.data.frame(v)
as.list(v)
```

as.spatvector

Coercion to a SpatVector, or to another SpatVector type

Description

Coercion of a SpatRaster or SpatExtent to a SpatVector (polygons); SpatRaster to a points SpatVector; or of a SpatVector to a lower level SpatVector type (polygons to lines or points; lines to points)

Usage

```
## S4 method for signature 'SpatRaster'
as.polygons(x, trunc=TRUE, dissolve=TRUE, values=TRUE, extent=FALSE)

## S4 method for signature 'SpatRaster'
as.points(x, values=TRUE)

## S4 method for signature 'SpatVector'
as.lines(x)

## S4 method for signature 'SpatVector'
as.points(x, multi=FALSE)

## S4 method for signature 'SpatExtent'
```

```

as.polygons(x, crs="")

## S4 method for signature 'SpatExtent'
as.lines(x, crs="")

## S4 method for signature 'SpatExtent'
as.points(x, crs="")

```

Arguments

x	SpatRaster or SpatVector
trunc	logical; truncate values to integers. Cels with the same value are merged. Therefore, if trunc=FALSE the object returned can be very large
dissolve	logical; combine cells with the same values?
values	logical; include cell values as attributes? If FALSE the cells are not dissolved and the object returned can be very large
multi	logical. If TRUE a multipoint geometry is returned
extent	logical. if TRUE, a polygon for the extent of the SpatRaster is returned. It has vertices for each grid cell, not just the four corners of the raster. This can be useful for more precise projection. In other cases it is better to do as.polygons(ext(x)) to get a much smaller object returned that covers the same extent
crs	character. The coordinate reference system (see crs)

Value

SpatVector

Examples

```

r <- rast(ncol=2, nrow=2)
values(r) <- 1:ncell(r)

as.points(r)
as.lines(ext(r), crs=crs(r))

if (gdal() >= "3.0.0") {
  p <- as.polygons(r)
  p
  as.lines(p)
  as.points(p)
}

```

atan2	<i>Two argument arc-tangent</i>
-------	---------------------------------

Description

For SpatRasters x and y , `atan2(y, x)` returns the angle in radians for the tangent y/x , handling the case when x is zero. See [Trig](#)

See [Math-methods](#) for other trigonometric and mathematical functions that can be used with SpatRasters.

Usage

```
## S4 method for signature 'SpatRaster,SpatRaster'
atan2(y, x)
```

Arguments

y	SpatRaster
x	SpatRaster

See Also

[Math-methods](#)

Examples

```
r1 <- rast(nrow=10, ncol=10)
r2 <- rast(nrow=10, ncol=10)
values(r1) <- (runif(ncell(r1))-0.5) * 10
values(r2) <- (runif(ncell(r1))-0.5) * 10
atan2(r1, r2)
```

autocorrelation	<i>Spatial autocorrelation</i>
-----------------	--------------------------------

Description

Compute spatial autocorrelation for a numeric vector or a SpatRaster. You can compute standard (global) Moran's I or Geary's C , or the local variations thereof (Anselin, 1995).

Usage

```
## S4 method for signature 'numeric'
autocor(x, w, method="moran")

## S4 method for signature 'SpatRaster'
autocor(x, w=matrix(c(1,1,1,1,0,1,1,1,1),3), method="moran", global=TRUE)
```

Arguments

x	numeric or SpatRaster
w	Spatial weights defined by or a rectangular matrix. For a SpatRaster this matrix must the sides must have an odd length (3, 5, ...)
global	logical. If TRUE global autocorrelation is computed instead of local autocorrelation
method	character. "moran" for Moran's I and "geary" for Geary's C

Details

The default setting uses a 3x3 neighborhood to compute "Queen's case" indices. You can use a filter (weights matrix) to do other things, such as "Rook's case", or different lags.

Value

numeric or SpatRaster

The `spdep` package for additional and more general approaches for computing spatial autocorrelation

Examples

```
r <- rast(nrows=10, ncols=10, xmin=0)
values(r) <- 1:ncell(r)

#autocor(r)

# rook's case neighbors
#f <- matrix(c(0,1,0,1,0,1,0,1,0), nrow=3)
#autocor(r, f)

## local
#rc <- autocor(r, w=f, global=FALSE)
```

barplot*Bar plot of a SpatRaster*

Description

Create a barplot of the values of a the first layer of a SpatRaster. For large datasets a regular sample with a size of approximately maxcells is used.

Usage

```
## S4 method for signature 'SpatRaster'  
barplot(height, maxcell=1000000, digits=0, breaks=NULL, col, ...)
```

Arguments

height	SpatRaster
maxcell	integer. To regularly subsample very large datasets
digits	integer used to determine how to round the values before tabulating. Set to NULL or to a large number if you do not want any rounding
breaks	breaks used to group the data as in cut
col	a color generating function such as rainbow (the default), or a vector of colors
...	additional arguments for plotting as in barplot

Value

A numeric vector (or matrix, when beside = TRUE) of the coordinates of the bar midpoints, useful for adding to the graph. See [barplot](#)

See Also

[hist](#), [boxplot](#)

Examples

```
f <- system.file("ex/test.tif", package="terra")  
r <- rast(f)  
barplot(r, digits=-2, las=2, ylab='Frequency')  
  
op <- par(no.readonly = TRUE)  
par(mai = c(1, 2, .5, .5))  
barplot(r, breaks=10, col=c('red', 'blue'), horiz=TRUE, digits=NULL, las=1)  
par(op)
```

boundaries	<i>Detect boundaries (edges)</i>
------------	----------------------------------

Description

Detect boundaries (edges). boundaries are cells that have more than one class in the 4 or 8 cells surrounding it, or, if `classes=FALSE`, cells with values and cells with NA.

Usage

```
## S4 method for signature 'SpatRaster'
boundaries(x, classes=FALSE, inner=TRUE,
           directions=8, filename="", ...)
```

Arguments

<code>x</code>	SpatRaster
<code>inner</code>	logical. If TRUE, "inner" boundaries are returned, else "outer" boundaries are returned
<code>classes</code>	character. Logical. If TRUE all different values are (after rounding) distinguished, as well as NA. If FALSE (the default) only edges between NA and non-NA cells are considered
<code>directions</code>	integer. Which cells are considered adjacent? Should be 8 (Queen's case) or 4 (Rook's case)
<code>filename</code>	character. Output filename
<code>...</code>	options for writing files as in writeRaster

Value

SpatRaster. Cell values are either 1 (a border) or 0 (not a border), or NA

See Also

[focal](#), [clump](#)

Examples

```
r <- rast(nrow=18, ncol=36, xmin=0)
v <- rep(NA, ncell(r))
v[150:250] <- 1
v[251:450] <- 2
values(r) <- v
bi <- boundaries(r)
bo <- boundaries(r, inner=FALSE)
bc <- boundaries(r, classes=TRUE)
#plot(bc)
```

 boxplot

Box plot of SpatRaster data

Description

Box plot of layers in a SpatRaster

Usage

```
## S4 method for signature 'SpatRaster'
boxplot(x, y=NULL, maxcell=100000, ...)
```

Arguments

x	SpatRaster
y	NULL or a SpatRaster. If x is a SpatRaster it used to group the values of x by "zone"
maxcell	Integer. Number of cells to sample from datasets
...	additional arguments passed to graphics::boxplot

See Also

[pairs](#), [hist](#)

Examples

```
r1 <- r2 <- r3 <- rast(ncol=10, nrow=10)
set.seed(409)
values(r1) <- rnorm(ncell(r1), 100, 40)
values(r2) <- rnorm(ncell(r1), 80, 10)
values(r3) <- rnorm(ncell(r1), 120, 30)
s <- c(r1, r2, r3)
names(s) <- c("Apple", "Pear", "Cherry")

boxplot(s, notch=TRUE, col=c("red", "blue", "orange"), main="Box plot", ylab="random", las=1)

op <- par(no.readonly = TRUE)
par(mar=c(4,6,2,2))
boxplot(s, horizontal=TRUE, col="lightskyblue", axes=FALSE)
axis(1)
axis(2, at=0:3, labels=c("", names(s)), las=1, cex.axis=.9, lty=0)
par(op)
```

buffer	<i>Create a buffer around vector objects or raster patches</i>
--------	--

Description

Calculate a buffer around all cells that are not NA in a `SpatRaster`, or around the geometries of a `SpatVector` (currently only implemented for points)

Note that the distance unit of the buffer width parameter is meters if the CRS is (+proj=longlat), and in map units (typically also meters) if not.

Usage

```
## S4 method for signature 'SpatRaster'
buffer(x, width, filename="", ...)

## S4 method for signature 'SpatVector'
buffer(x, width, quadsegs=10, capstyle="round")
```

Arguments

x	SpatRaster or SpatVector
width	numeric. Unit is meter if x has a longitude/latitude CRS, or mapunits in other cases. Should be > 0 for SpatRaster
filename	character. Output filename
...	additional arguments for writing files as in writeRaster
quadsegs	positive integer. Number of line segments to use to draw a quart circle
capstyle	character. Style of cap to use at the ends of the geometry. Allowed values: "round", "flat", "square" (ignored for now)

Value

`SpatRaster`

See Also

[distance](#)

Examples

```
r <- rast(ncol=36,nrow=18)
v <- rep(NA, ncell(r))
v[500] <- 1
values(r) <- v
b <- buffer(r, width=5000000)
plot(b)
```

```
v <- vect(rbind(c(10,10), c(0,60)))
b <- buffer(v, 20)
plot(b)
points(v)

crs(v) <- "+proj=longlat +datum=WGS84"
b <- buffer(v, 1500000)
plot(b)
points(v)
```

c

Combine SpatRaster or SpatVector objects

Description

With `c` you can:

- Combine `SpatRaster` objects. They must have the same extent and resolution. Also see [add<-](#)
- Add a `SpatRaster` to a `SpatRasterDataset`
- Append `SpatVector` objects. They must be of the same geometry type. See [svc](#) for combining different geometry type objects in a `SpatVectorCollection`
- Add a `SpatVector` to a `SpatVectorCollection`

Usage

```
## S4 method for signature 'SpatRaster'
c(x, ...)

## S4 method for signature 'SpatRasterDataset'
c(x, ...)

## S4 method for signature 'SpatVector'
c(x, ...)

## S4 method for signature 'SpatVectorCollection'
c(x, ...)
```

Arguments

x	<code>SpatRaster</code> , <code>SpatVector</code> , <code>SpatRasterDataset</code> or <code>SpatVectorCollection</code>
...	as for x (you can only combine raster with raster data and vector with vector data)

Value

Same class as x

See Also

[collapse](#), [add<-](#)

Examples

```
r <- rast(nrow=5, ncol=9)
values(r) <- 1:ncell(r)
x <- c(r, r*2, r*3)
```

cartogram

Cartogram

Description

Make a cartogram, that is, a map where the area of polygons is made proportional to another variable. This can be a good way to map raw count data (e.g. votes).

Usage

```
## S4 method for signature 'SpatVector'
cartogram(x, var, type)
```

Arguments

x	SpatVector
var	character. A variable name in x
type	character. Cartogram type, only "nc" (non-contiguous) is currently supported

Value

SpatVector

See Also

[plot](#), [rescale](#)

Examples

```
f <- system.file("ex/lux.shp", package="terra")
v <- vect(f)
v$value <- 1:12
p <- cartogram(v, "value", "nc")
plot(v, col="light gray", border="gray")
lines(p, col="red", lwd=2)
```

cells *Get cell numbers*

Description

Get the cell numbers covered by a `SpatVector` or `SpatExtent`. Or that match values in a vector; or all non NA values.

Usage

```
## S4 method for signature 'SpatRaster,missing'
cells(x, y)

## S4 method for signature 'SpatRaster,numeric'
cells(x, y)

## S4 method for signature 'SpatRaster,SpatVector'
cells(x, y, method="simple", weights=FALSE, touches=is.lines(y))

## S4 method for signature 'SpatRaster,SpatExtent'
cells(x, y)
```

Arguments

x	<code>SpatRaster</code>
y	<code>SpatVector</code> , <code>SpatExtent</code> , 2-column matrix representing points, numeric representing values to match, or missing
method	character. method for extracting values with points. The default is "simple", the alternative is "bilinear"
weights	logical. If TRUE and y has polygons, the fraction of each cell that is covered is returned as well
touches	logical. If TRUE, values for all cells touched by lines or polygons are extracted, not just those on the line render path, or whose center point is within the polygon. Not relevant for points

Value

matrix if y is a `SpatVector`, otherwise a vector.

Examples

```
r <- rast(ncols=10, nrows=10)
values(r) <- 1:ncell(r)
r[c(1:25, 31:100)] <- NA
r <- ifel(r > 28, r + 10, r)

# get all non-NA cell numbers
```

```
cells(r)

# get cell numbers that match values
cells(r, c(28,38))

m <- cbind(x=c(0,10,-30), y=c(40,-10,20))
cellFromXY(r, m)

v <- vect(m)
cells(r, v)

f <- system.file("ex/lux.shp", package="terra")
v <- vect(f)
r <- rast(v)
#cv <- cells(r, v)

#z <- cells(r,ext(v))
#xy <- xyFromCell(r, z)
#plot(v)
#points(xy)
```

centroids

Get centroids

Description

Get the centroids for the polygons of a `SpatVector`

Usage

```
## S4 method for signature 'SpatVector'
centroids(x)
```

Arguments

x `SpatVector`

Value

`SpatVector` of points

Examples

```
f <- system.file("ex/lux.shp", package="terra")
v <- vect(f)
x <- centroids(v)
```

`clamp`*Clamp values*

Description

Clamp values to a minimum and maximum value. That is, all values below a lower threshold value and above the upper threshold value become either NA, or, if `values=TRUE`, become the threshold value

Usage

```
## S4 method for signature 'SpatRaster'  
clamp(x, lower=-Inf, upper=Inf, values=TRUE, filename="", ...)
```

Arguments

<code>x</code>	SpatRaster
<code>lower</code>	numeric. lowest value
<code>upper</code>	numeric. highest value
<code>values</code>	logical. If FALSE values outside the clamping range become NA, if TRUE, they get the extreme values
<code>filename</code>	character. Output filename
<code>...</code>	additional arguments for writing files as in writeRaster

Value

SpatRaster

See Also

[classify](#)

Examples

```
r <- rast(ncols=10, nrows=10)  
values(r) <- 1:ncell(r)  
rc <- clamp(r, 25, 75)  
rc
```

classify	<i>Classify (or reclassify) cell values</i>
----------	---

Description

Classify values of a `SpatRaster`. The function (re-)classifies groups of values to other values.

Classification can be based on ranges "from-to-becomes" or on specific values "is-becomes", or on "cuts".

With "from-to-becomes" or "is-becomes", classification is done with matrix `rcl`, in the row order of the matrix. Thus, if there are overlapping ranges or values, the first time a number is within a range determines the reclassification value.

With "cuts" the values are sorted, so that the order in which they are provided does not matter.

Usage

```
## S4 method for signature 'SpatRaster'
classify(x, rcl, include.lowest=FALSE, right=TRUE,
         othersNA=FALSE, filename="", ...)
```

Arguments

<code>x</code>	<code>SpatRaster</code>
<code>rcl</code>	matrix for classification. This matrix must have 1, 2 or 3 columns. If there are three columns, the first two columns are "from" "to" of the input values, and the third column "becomes" has the new value for that range. The two column matrix ("is", "becomes") can be useful for re-classifying integer values. In that case, the <code>right</code> argument is automatically set to <code>NA</code> . A single column matrix or a vector is interpreted as a set of cuts. In that case the values are classified based on their location inbetween the cut-values
<code>include.lowest</code>	logical, indicating if a value equal to the lowest value in <code>rcl</code> (or highest value in the second column, for <code>right=FALSE</code>) should be included.
<code>right</code>	logical, indicating if the intervals should be closed on the right (and open on the left) or vice versa. The default is <code>TRUE</code> . A special case is to use <code>right=NA</code> . In this case both the left and right intervals are open
<code>othersNA</code>	logical. If <code>TRUE</code> , values that are not matched become <code>NA</code> . If <code>FALSE</code> , they retain their original value.
<code>filename</code>	character. Output filename
<code>...</code>	Additional arguments for writing files as in writeRaster

Value

`SpatRaster`

Note

For model-based classification see [predict](#)

Examples

```
r <- rast(ncols=10, nrows=10)
values(r) <- (0:99)/99

## from-to-becomes
# classify the values into three groups
# all values >= 0 and <= 0.25 become 1, etc.
m <- c(0, 0.25, 1,
       0.25, 0.5, 2,
       0.5, 1, 3)
rclmat <- matrix(m, ncol=3, byrow=TRUE)
rc1 <- classify(r, rclmat, include.lowest=TRUE)

## cuts
# equivalent to the above
rc2 <- classify(r, c(0, 0.25, 0.5, 1), include.lowest=TRUE)

## is-becomes
x <- round(r*3)
unique(x)
# replace 0 with NA
y <- classify(x, cbind(0, NA))
unique(y)

# multiple replacements
m <- rbind(c(2, 200), c(3, 300))
m

rcx1 <- classify(x, m)
unique(rcx1)

rcx2 <- classify(x, m, othersNA=TRUE)
unique(rcx2)
```

click

Query by clicking on a map

Description

Click on a map (plot) to get the coordinates or the values of a `SpatRaster` or `SpatVector` at that location. For a `SpatRaster` you can also get the coordinates and cell number of the location.

Usage

```
## S4 method for signature 'SpatRaster'
click(x, n=Inf, id=FALSE, xy=FALSE, cell=FALSE, type="n", show=TRUE, ...)

## S4 method for signature 'SpatVector'
click(x, n=1, type="n", ...)

## S4 method for signature 'missing'
click(x, n=1, type="n", ...)
```

Arguments

x	SpatRaster or SpatVector, or missing
n	number of clicks on the plot (map)
id	logical. If TRUE, a numeric ID is shown on the map that corresponds to the row number of the output
xy	logical. If TRUE, xy coordinates are included in the output
cell	logical. If TRUE, cell numbers are included in the output
type	one of "n", "p", "l" or "o". If "p" or "o" the points are plotted; if "l" or "o" they are joined by lines. See ?locator
show	logical. Print the values after each click?
...	additional graphics parameters used if type != "n" for plotting the locations. See ?locator

Value

The value(s) of x at the point(s) clicked on (or touched by the box drawn).

Note

The plot only provides the coordinates for a spatial query, the values are read from the SpatRaster that is passed as an argument. Thus you can extract values from an object that has not been plotted, as long as it spatially overlaps with the extent of the plot.

Unless the process is terminated prematurely values at at most n positions are determined. The identification process can be terminated by hitting Esc, or by clicking the right mouse button and selecting "Stop" from the menu, or from the "Stop" menu on the graphics window.

See Also

[draw](#)

Examples

```
## Not run:
r <-rast(system.file("ex/elev.tif", package="terra"))
plot(r)
click(r, n=1)
```

```
## now click on the plot (map)
## End(Not run)
```

coerce

Coercion of a SpatRaster to other object types

Description

Coercion to other object types

Usage

```
## S4 method for signature 'SpatRaster'
as.vector(x, mode='any')

## S4 method for signature 'SpatRaster'
as.matrix(x, wide=FALSE)

## S4 method for signature 'SpatRaster'
as.array(x)
```

Arguments

x	SpatRaster or SpatVector
mode	this argument is ignored
wide	logical

Value

vector, matrix, array

See Also

[as.data.frame](#) and [as.polygons](#)

Examples

```
r <- rast(ncol=2, nrow=2)
values(r) <- 1:ncell(r)

as.vector(r)
as.matrix(r)
as.matrix(r, wide=TRUE)
as.data.frame(r, xy=TRUE)
as.array(r)
```

collapse	<i>Collapse SpatRaster or SpatRasterDataset objects</i>
----------	---

Description

Combines sources within a SpatRaster object (that are in memory, or from the same file) to allow for faster processing.

Or combine subdatasets into a SpatRaster.

Usage

```
## S4 method for signature 'SpatRaster'
collapse(x)

## S4 method for signature 'SpatRasterDataset'
collapse(x)
```

Arguments

x SpatRaster or SpatRasterDataset

Value

SpatRaster

Examples

```
r <- rast(nrow=5, ncol=9, vals=1:45)
x <- c(r, r*2, r*3)
x
collapse(x)
```

colors	<i>Color table</i>
--------	--------------------

Description

Get the color table(s) associated with a SpatRaster if there are any

Usage

```
## S4 method for signature 'SpatRaster'
coltab(x)

## S4 replacement method for signature 'SpatRaster'
coltab(x, layer=1)<-value
```

Arguments

x	SpatRaster
layer	positive integer, the layer number or name
value	a three (red,green,blue) or four (alpha) column data.frame with no more than 256 rows

Value

data.frame

Examples

```
r <- rast(ncol=3, nrow=2, vals=0:5)
coltb <- data.frame(t(col2rgb(rainbow(6, end=.9), alpha=TRUE)))
coltb

plot(r)
coltab(r) <- coltb
plot(r)

tb <- coltab(r)
class(tb)
dim(tb[[1]])
```

compareGeom

Compare geometries of SpatRasters

Description

Evaluate whether two SpatRaster objects have the same extent, number of rows and columns, projection, resolution, and origin (or a subset of these comparisons).

Usage

```
## S4 method for signature 'SpatRaster,SpatRaster'
compareGeom(x, y, ..., lyrs=FALSE,
            crs=TRUE, warncrs=FALSE, ext=TRUE, rowcol=TRUE, res=FALSE)
```

Arguments

x	SpatRaster
y	SpatRaster
...	Additional SpatRasters
lyrs	logical. If TRUE, the number of layers is compared
crs	logical. If TRUE, coordinate reference systems are compared
warncrs	logical. If TRUE, a warning is given if the crs is different (instead of an error)

ext	logical. If TRUE, bounding boxes are compared
rowcol	logical. If TRUE, number of rows and columns of the objects are compared
res	logical. If TRUE, resolutions are compared (redundant when checking extent and rowcol)

Examples

```
r1 <- rast()
r2 <- rast()
r3 <- rast()
compareGeom(r1, r2, r3)
nrow(r3) <- 10

## Not run:
compareGeom(r1, r3)

## End(Not run)
```

contour

Contour plot

Description

Contour lines of a SpatRaster. Use add=TRUE to add the lines to the current plot. See [contour](#) for details.

if filled=TRUE, a new filled contour plot is made. See [filled.contour](#) for details.

as.contour returns the contour lines as a SpatVector.

Usage

```
## S4 method for signature 'SpatRaster'
contour(x, maxcells=100000, filled=FALSE, ...)

## S4 method for signature 'SpatRaster'
as.contour(x, maxcells=100000, ...)
```

Arguments

x	SpatRaster. Only the first layer is used
maxcells	maximum number of pixels used to create the contours
filled	logical. If TRUE, a filled.contour plot is made
...	any argument that can be passed to contour or filled.contour (graphics package)

See Also

[plot](#)

Examples

```
r <- rast(system.file("ex/elev.tif", package="terra"))
plot(r)
contour(r, add=TRUE)

v <- as.contour(r)
plot(r)
lines(v)

contour(r, filled=TRUE, nlevels=5)

## if you want a SpatVector with contour lines
#template <- disaggregate(rast(r), 10)
#rr <- resample(r, template)
#rr <- floor(rr/100) * 100
#v <- as.polygons(rr)
#plot(v, 1, col=terrain.colors(7))
```

convexhull

Convex hull

Description

Get the convex hull of a vector dataset

Usage

```
## S4 method for signature 'SpatVector'
convexhull(x)
```

Arguments

x SpatVector

Value

SpatVector

Examples

```
p <- vect(system.file("ex/lux.shp", package="terra"))
h <- convexhull(p)
```

coords *Get the coordinates of SpatVector geometries or SpatRaster cells*

Description

Get the coordinates of a SpatVector or SpatRaster cells. A matrix or data.frame of the x (longitude) and y (latitude) coordinates is returned.

Usage

```
## S4 method for signature 'SpatVector'
coords(x, df=FALSE)
```

```
## S4 method for signature 'SpatRaster'
coords(x, df=FALSE)
```

Arguments

x SpatVector
 df logical. If TRUE a data.frame is returned in stead of a matrix

Value

matrix or data.frame

See Also

[geom](#) returns the complete structure of SpatVector geometries

Examples

```
x1 <- rbind(c(-175,-20), c(-140,55), c(10, 0), c(-140,-60))
x2 <- rbind(c(-125,0), c(0,60), c(40,5), c(15,-45))
x3 <- rbind(c(-10,0), c(140,60), c(160,0), c(140,-55))
x4 <- rbind(c(80,0), c(105,13), c(120,2), c(105,-13))
z <- rbind(cbind(object=1, part=1, x1), cbind(object=2, part=1, x2),
          cbind(object=3, part=1, x3), cbind(object=3, part=2, x4))
colnames(z)[3:4] <- c('x', 'y')
z <- cbind(z, hole=0)
z[(z[, "object"]==3 & z[, "part"]==2), "hole"] <- 1

p <- vect(z, "polygons")
coords(p)

f <- system.file("ex/lux.shp", package="terra")
v <- vect(f)
g <- coords(v)
head(g)
```

copy

Deep copy

Description

Make a deep copy of a `SpatRaster`. This is occasionally useful when wanting to use a replacement function in a shallow copy. If use a replacement function to change an object, its shallow copies will also be changed.

Usage

```
## S4 method for signature 'SpatRaster'  
copy(x)
```

Arguments

x `SpatRaster`

Value

`SpatRaster`

Examples

```
r <- rast(ncols=10, nrows=10, nl=3)  
tm <- as.Date("2001-05-03") + 1:3  
time(r) <- tm  
time(r)  
x <- r  
time(x) <- tm + 365  
time(x)  
time(r)  
  
y <- copy(r)  
time(y) <- tm - 365  
time(y)  
time(r)  
  
# or make a new object like this  
z <- rast(r)  
time(z) <- tm  
time(z)  
time(r)
```

cover	<i>Replace values with values from another object</i>
-------	---

Description

Replace NA or other values in `SpatRaster` `x` with the values of `SpatRaster` `y`

For polygons: areas of `x` that overlap with `y` are replaced by `y` or, if `identity=TRUE` intersected with `y`.

Usage

```
## S4 method for signature 'SpatRaster,SpatRaster'
cover(x, y, values=NA, filename="", ...)
```

```
## S4 method for signature 'SpatVector,SpatVector'
cover(x, y, identity=FALSE)
```

Arguments

<code>x</code>	<code>SpatRaster</code> or <code>SpatVector</code>
<code>y</code>	Same as <code>x</code>
<code>values</code>	numeric. The cell values in <code>x</code> to be replaced by the values in <code>y</code>
<code>filename</code>	character. Output filename
<code>...</code>	additional arguments for writing files as in writeRaster
<code>identity</code>	logical. If <code>TRUE</code> overlapping areas are intersected rather than replaced

Value

`SpatRaster`

Examples

```
r1 <- r2 <- rast(ncols=36, nrows=18)
values(r1) <- 1:ncell(r1)
values(r2) <- runif(ncell(r2))
r2 <- classify(r2, cbind(-Inf, 0.5, NA))
r3 <- cover(r2, r1)
```

```
p <- vect(system.file("ex/lux.shp", package="terra"))
e <- as.polygons(ext(6, 6.4, 49.75, 50))
values(e) <- data.frame(y=10)
#cv <- cover(p, e)
#plot(cv, col=rainbow(12))
#ci <- cover(p, e, identity=TRUE)
#lines(e, lwd=3)
```

```
#plot(ci, col=rainbow(12))
#lines(e, lwd=3)
```

crop

Cut out a geographic subset

Description

Cut out a part of a `SpatRaster` with a `SpatExtent`, or another object from which an extent can be obtained. With a `SpatRaster` you can only extract rectangular areas, but see [mask](#) for setting cell values within `SpatRaster` to NA.

You can crop a `SpatVector` with a rectangle, or with another vector (if these are not polygons, the minimum convex hull is used). Unlike with [intersect](#) the geometries and attributes of `y` are not transferred to the output.

Usage

```
## S4 method for signature 'SpatRaster'
crop(x, y, snap="near", filename="", ...)
```

```
## S4 method for signature 'SpatVector,ANY'
crop(x, y)
```

```
## S4 method for signature 'SpatVector,SpatVector'
crop(x, y)
```

Arguments

<code>x</code>	<code>SpatRaster</code> or <code>SpatVector</code>
<code>y</code>	<code>SpatExtent</code> or other object that has a <code>SpatExtent</code> (<code>ext</code> returns a <code>SpatExtent</code>), or a <code>SpatVector</code> to crop another <code>SpatVector</code>
<code>snap</code>	character. One of "near", "in", or "out"
<code>filename</code>	character. Output filename
<code>...</code>	additional arguments for writing files as in writeRaster

Value

`SpatRaster`

See Also

[intersect](#)

Examples

```

r <- rast(xmin=0, xmax=10, ymin=0, ymax=10, nrows=25, ncols=25)
values(r) <- 1:ncell(r)
e <- ext(-5, 5, -5, 5)
rc <- crop(r, e)

# vector
f <- system.file("ex/lux.shp", package="terra")
v <- vect(f)
e <- ext(6.15, 6.3, 49.7, 49.8)
x <- crop(v, e)
#plot(x, "NAME_1")

```

crosstab

*Cross-tabulate***Description**

Cross-tabulate the layers of a SpatRaster to create a contingency table.

Usage

```

## S4 method for signature 'SpatRaster,missing'
crosstab(x, digits=0, long=FALSE, useNA=FALSE)

```

Arguments

x	SpatRaster
digits	integer. The number of digits for rounding the values before cross-tabulation
long	logical. If TRUE the results are returned in 'long' format data.frame instead of a table
useNA	logical, indicating if the table should includes counts of NA values

Value

A table or data.frame

See Also

[freq](#), [zonal](#)

Examples

```

r <- s <- rast(nc=5, nr=5)
set.seed(1)
values(r) <- runif(ncell(r)) * 2
values(s) <- runif(ncell(r)) * 3
x <- c(r, s)

crosstab(x)

rs <- r/s
r[1:5] <- NA
s[20:25] <- NA
x <- c(r, s, rs)
crosstab(x, useNA=TRUE, long=TRUE)

```

crs

Get or set a coordinate reference system

Description

Get or set the coordinate reference system (CRS), also referred to as a "projection" of a `SpatRaster` or `SpatVector` object.

Setting a new CRS does not change the data itself, it just changes the label. So you should only set the CRS of a dataset (if it does not come with one) to what it *is*, not to what you would *like* it to be. See [project](#) to *transform* spatial from one CRS to another.

Usage

```

## S4 method for signature 'SpatRaster'
crs(x, proj4=FALSE, describe=FALSE)

## S4 method for signature 'SpatVector'
crs(x, proj4=FALSE, describe=FALSE)

## S4 replacement method for signature 'SpatRaster'
crs(x)<-value

## S4 replacement method for signature 'SpatVector'
crs(x)<-value

```

Arguments

x	SpatRaster or SpatVector
proj4	logical. If TRUE the crs is returned in PROJ.4 notation. But note that GDAL now only supports the WGS84 and NAD83 datums with this notation
describe	logical. If TRUE the name, EPSG code, and the name and extent of the area of use are returned if known

value character string describing a coordinate reference system. This can be in a WKT format, as a EPSG code, or a PROJ.4 "+" format (but see Note)

Value

character or modified SpatRaster/Vector

Note

Because of changes in the PROJ library that is behind the coordinate transformations, when using the PROJ.4 format, the datum should be WGS84 – if you want to transform your data to a different coordinate reference system)

Examples

```
r <- rast()
crs(r)
crs(r, describe=TRUE, proj4=TRUE)

crs(r) <- "+proj=lcc +lat_1=48 +lat_2=33 +lon_0=-100 +ellps=WGS84"
crs(r)

# You can also use epsg codes
crs(r) <- "epsg:25831"
crs(r, describe=TRUE)$area
```

density

Density plot

Description

Create density plots of the cell values of a SpatRaster

Usage

```
## S4 method for signature 'SpatRaster'
density(x, maxcells=100000, plot=TRUE, main, ...)
```

Arguments

x	SpatRaster
maxcells	the maximum number of (randomly sampled) cells to be used for creating the plot
plot	if TRUE produce a plot, else return a density object
main	character. Caption of plot(s)
...	additional arguments passed to plot

Value

density plot (and a density object, returned invisibly if plot=TRUE)

Examples

```
logo <- rast(system.file("ex/logo.tif", package="terra"))
density(logo)
```

depth	<i>depth of SpatRaster layers</i>
-------	-----------------------------------

Description

Get or set the depth of the layers of a SpatRaster. Experimental.

Usage

```
## S4 method for signature 'SpatRaster'
depth(x)

## S4 replacement method for signature 'SpatRaster'
depth(x)<-value
```

Arguments

x	SpatRaster
value	numeric vector

Value

numeric

See Also

[time](#)

Examples

```
s <- rast(system.file("ex/logo.tif", package="terra"))

depth(s) <- 1:3
depth(s)
```

describe	<i>describe</i>
----------	-----------------

Description

Describe the properties of spatial data in a file as generated with the "GDALInfo" tool.

Usage

```
## S4 method for signature 'character'
describe(x, sds=FALSE, meta=FALSE, parse=FALSE, options="", print=FALSE, open_opt="")

desc(x)
```

Arguments

x	character. The name of a file with spatial data. Or a fully specified subdataset within a file such as "NETCDF:\AVHRR.nc\NDVI"
sds	logical. If TRUE the description or metadata of the subdatasets is returned (if available)
meta	logical. Get the file level metadata instead
parse	logical. If TRUE, metadata for subdatasets is parsed into components (if meta=TRUE)
options	character. A vector of valid options (if meta=FALSE) including "json", "mm", "stats", "hist", "nogcp", "nomd", "norat", "noct", "nofl", "checksum", "proj4", "listmdd", "mdd <value>" where <value> specifies a domain or 'all', "wkt_format <value>" where value is one of 'WKT1', 'WKT2', 'WKT2_2015', or 'WKT2_2018', "sd <subdataset>" where <subdataset> is the name or identifier of a sub-dataset. See https://gdal.org/programs/gdalinfo.html . Ignored if sds=TRUE
print	logical. If TRUE, print the results
open_opt	character. Driver specific open options

Value

character (invisibly, if print=FALSE)

Examples

```
f <- system.file("ex/elev.tif", package="terra")
describe(f)
describe(f, meta=TRUE)
#g <- desc(f, options=c("json", "nomd", "proj4"))
#cat(g, "\n")
```

diff	<i>diff</i>
------	-------------

Description

Returns lagged differences.

Usage

```
## S4 method for signature 'SpatRaster'
diff(x, filename="", ...)
```

Arguments

x	SpatRaster
filename	character. Output filename
...	additional arguments for writing files as in writeRaster

Value

SpatRaster

Examples

```
s <- rast(system.file("ex/logo.tif", package="terra"))
d <- diff(s)
```

dimensions	<i>Dimensions of a SpatRaster or SpatVector and related objects</i>
------------	---

Description

Get the number of rows (nrow), columns (ncol), cells (ncell), layers (nlyr), sources (nsrc) or the spatial resolution of a SpatRaster; (length) returns the number of sub-datasets in a SpatRaster-Dataset or SpatVectorCollection.

The size of a SpatRaster x is ncell(x) * nlyr(x). For a SpatVector length(x) is the same as nrow(x).

You can also set the number of rows or columns or layers. When setting dimensions, all cell values are dropped.

Usage

```
## S4 method for signature 'SpatRaster'  
ncol(x)  
  
## S4 method for signature 'SpatRaster'  
nrow(x)  
  
## S4 method for signature 'SpatRaster'  
nlyr(x)  
  
## S4 method for signature 'SpatRaster'  
ncell(x)  
  
## S4 method for signature 'SpatRaster'  
size(x)  
  
## S4 method for signature 'SpatRaster'  
nsrc(x)  
  
## S4 replacement method for signature 'SpatRaster,numeric'  
ncol(x)<-value  
  
## S4 replacement method for signature 'SpatRaster,numeric'  
nrow(x)<-value  
  
## S4 replacement method for signature 'SpatRaster,numeric'  
nlyr(x)<-value  
  
## S4 method for signature 'SpatRaster'  
res(x)  
  
## S4 replacement method for signature 'SpatRaster,numeric'  
res(x)<-value  
  
## S4 method for signature 'SpatRaster'  
xres(x)  
  
## S4 method for signature 'SpatRaster'  
yres(x)  
  
## S4 method for signature 'SpatVector'  
ncol(x)  
  
## S4 method for signature 'SpatVector'  
nrow(x)  
  
## S4 method for signature 'SpatVector'  
size(x)
```

```
## S4 method for signature 'SpatVector'  
length(x)
```

Arguments

x	SpatRaster or SpatVector or related objects
value	For ncol and nrow: positive integer. For res: one or two positive numbers

Value

integer

See Also

[ext](#)

Examples

```
r <- rast()  
ncol(r)  
nrow(r)  
nlyr(r)  
dim(r)  
nsrc(r)  
ncell(r)  
size(r)  
  
rr <- c(r,r)  
nlyr(rr)  
nsrc(rr)  
ncell(rr)  
size(rr)  
  
nrow(r) <- 18  
ncol(r) <- 36  
# equivalent to  
dim(r) <- c(18, 36)  
  
dim(r)  
dim(r) <- c(10, 10, 5)  
dim(r)  
  
xres(r)  
yres(r)  
res(r)  
  
res(r) <- 1/120  
# different xres and yres  
res(r) <- c(1/120, 1/60)
```

disaggregate	<i>Disaggregate raster cells</i>
--------------	----------------------------------

Description

SpatRaster: Create a `SpatRaster` with a higher resolution (smaller cells). The values in the new `SpatRaster` are the same as in the larger original cells.

SpatVector: Separate multi-objects (points, lines, polygons) into single objects.

Usage

```
## S4 method for signature 'SpatRaster'
disaggregate(x, fact, method="near", filename="", ...)
```

```
## S4 method for signature 'SpatVector'
disaggregate(x)
```

Arguments

<code>x</code>	<code>SpatRaster</code> or <code>SpatVector</code>
<code>fact</code>	positive integer. Aggregation factor expressed as number of cells in each direction (horizontally and vertically). Or two integers (horizontal and vertical aggregation factor) or three integers (when also aggregating over layers)
<code>method</code>	character. Either "near" for nearest or "bilinear" for bilinear interpolation
<code>filename</code>	character. Output filename
<code>...</code>	additional arguments for writing files as in writeRaster

Value

`SpatRaster`

See Also

[aggregate](#), [resample](#)

Examples

```
r <- rast(ncols=10, nrows=10)
rd <- disaggregate(r, fact=c(10, 2))
ncol(rd)
nrow(rd)
values(r) <- 1:ncell(r)
rd <- disaggregate(r, fact=c(4, 2))
```

distance	<i>Geographic distance</i>
----------	----------------------------

Description

If x is a SpatRaster:

If y is missing this method computes the distance, for all cells that are NA in SpatRaster x to the nearest cell that is not NA. If argument `grid=TRUE`, the distance is computed using a path that goes through the centers of the 8 neighboring cells.

If y is a SpatVector, the distance to that SpatVector is computed for all cells. For lines and polygons this is done after rasterization; and only the overlapping areas of the vector and raster are considered (for now).

If x is a SpatVector:

If y is missing, a distance matrix between all object in x is computed. An distance matrix object of class "dist" is returned.

If y is a SpatVector the geographic distance between all objects is computed (and a matrix is returned). If both sets have the same number of points, and `pairwise=TRUE`, the distance between each pair of objects is computed, and a vector is returned.

Usage

```
## S4 method for signature 'SpatRaster,missing'
distance(x, y, grid=FALSE, filename="", ...)

## S4 method for signature 'SpatRaster,SpatVector'
distance(x, y, filename="", ...)

## S4 method for signature 'SpatVector,ANY'
distance(x, y, sequential=FALSE, pairs=FALSE, symmetrical=TRUE)

## S4 method for signature 'SpatVector,SpatVector'
distance(x, y, pairwise=FALSE)

## S4 method for signature 'matrix,matrix'
distance(x, y, lonlat, pairwise=FALSE)

## S4 method for signature 'matrix,ANY'
distance(x, y, lonlat, sequential=FALSE)
```

Arguments

x	SpatRaster, SpatVector, or two-column matrix (x,y) or (lon,lat)
y	missing or SpatVector, or two-column matrix
grid	logical. If TRUE, distance is computed using a path that goes through the centers of the 8 neighboring cells

filename	character. Output filename
...	additional arguments for writing files as in writeRaster
sequential	logical. If TRUE, the distance between sequential geometries is returned
pairwise	logical. If TRUE and if x and y have the same size (number of rows), the pairwise distances are returned instead of the distances between all elements
lonlat	logical. If TRUE the coordinates are interpreted as angular (longitude/latitude). If FALSE they are interpreted as planar
pairs	logical. If TRUE a "from", "to", "distance" matrix is returned
symmetrical	logical. If TRUE and pairs=TRUE, the distance between a pair is only included once. The distance between geometry 1 and 3 is included, but the (same) distance between 3 and 1 is not

Value

SpatRaster or numeric or matrix or distance matrix (object of class "dist")

Note

The distance unit is in meters.

A distance matrix can be coerced into a matrix with `as.matrix`

Examples

```
#lonlat
r <- rast(ncol=36,nrow=18, crs="+proj=longlat +datum=WGS84")
v <- rep(NA, ncell(r))
v[500] <- 1
values(r) <- v
d <- distance(r)
plot(d / 100000)

#planar
r <- rast(ncol=36,nrow=18, crs="+proj=utm +zone=1 +datum=WGS84")
v <- rep(NA, ncell(r))
v[500] <- 1
values(r) <- v
d <- distance(r)

p1 <- vect(rbind(c(0,0), c(90,30), c(-90,-30)), crs="+proj=longlat +datum=WGS84")
dp <- distance(r, p1)

d <- distance(p1)
d
as.matrix(d)

p2 <- vect(rbind(c(30,-30), c(25,40), c(-9,-3)), crs="+proj=longlat +datum=WGS84")
dd <- distance(p1, p2)
dd
pd <- distance(p1, p2, pairwise=TRUE)
```

```

pd
pd == diag(dd)

# polygons, lines
crs <- "+proj=utm +zone=1"
p1 <- vect("POLYGON ((0 0, 8 0, 8 9, 0 9, 0 0))", crs=crs)
p2 <- vect("POLYGON ((5 6, 15 6, 15 15, 5 15, 5 6))", crs=crs)
p3 <- vect("POLYGON ((2 12, 3 12, 3 13, 2 13, 2 12))", crs=crs)
p <- c(p1, p2, p3)
L1 <- vect("LINESTRING(1 11, 4 6, 10 6)", crs=crs)
L2 <- vect("LINESTRING(8 14, 12 10)", crs=crs)
L3 <- vect("LINESTRING(1 8, 12 14)", crs=crs)
lns <- c(L1, L2, L3)
pts <- vect(cbind(c(7,10,10), c(3,5,6)), crs=crs)

distance(p1,p3)
distance(p)
distance(p,pts)
distance(p,lns)
distance(pts,lns)

```

dots

Make a dot-density map

Description

Create the dots for a dot-density map and add these to the current map. Dot-density maps are made to display count data. For example of population counts, where each dot represents n persons. The dots are returned as a `SpatVector`. If there is an active graphics device, the dots are added to it with [points](#).

Usage

```

## S4 method for signature 'SpatVector'
dots(x, field, size, ...)

```

Arguments

<code>x</code>	<code>SpatVector</code>
<code>field</code>	character of numeric indicating field name. Or numeric vector of the same length as <code>x</code>
<code>size</code>	positive number indicating the number of cases associated with each dot
<code>...</code>	graphical arguments passed to <code>points</code>

Value

`SpatVector` (invisibly)

See Also

[plot](#), [cartogram](#), [points](#)

Examples

```
f <- system.file("ex/lux.shp", package="terra")
v <- vect(f)
v$population <- v$AREA^2
plot(v)
d <- dots(v, "population", 1000)
d
```

draw

Draw a polygon, line, extent, or points

Description

Draw on a plot (map) to get a `SpatVector` or `SpatExtent` object for later use. After calling the function, start clicking on the map. To finish, right-click and select "stop".

Usage

```
## S4 method for signature 'character'
draw(x="extent", col="red", lwd=2, ...)
```

Arguments

<code>x</code>	character. The type of object to draw. One of "extent", "polygon", "line", or "points"
<code>col</code>	the color to be used
<code>lwd</code>	the width of the lines to be drawn
<code>...</code>	additional arguments passed to locator

Value

`SpatVector` or `SpatExtent`

See Also

[locator](#)

erase

Erase parts of a SpatVector object

Description

Erase parts of a SpatVector with another SpatVector (or SpatExtent). The inverse of this can be done with [intersect](#) and [crop](#).

Usage

```
## S4 method for signature 'SpatVector,SpatVector'  
erase(x, y)
```

```
## S4 method for signature 'SpatVector,SpatExtent'  
erase(x, y)
```

Arguments

x	SpatVector
y	SpatVector or SpatExtent

Value

SpatVector or SpatExtent

See Also

The equivalent for SpatRaster is [mask](#)

Examples

```
f <- system.file("ex/lux.shp", package="terra")  
v <- vect(f)  
e <- ext(5.6, 6, 49.55, 49.7)  
x <- erase(v, e)  
  
p <- vect("POLYGON ((5.8 49.8, 6 49.9, 6.15 49.8, 6 49.6, 5.8 49.8))")  
y <- erase(v, p)
```

 expand
*Expand***Description**

Expand the extent of a `SpatRaster`. See [crop](#) if you (also) want to remove rows or columns.

You can also enlarge a `SpatExtent` with this method, or with algebraic notation (see examples)

Usage

```
## S4 method for signature 'SpatRaster'
expand(x, y, filename="", overwrite=FALSE, ...)
```

```
## S4 method for signature 'SpatExtent'
expand(x, y)
```

Arguments

<code>x</code>	<code>SpatRaster</code> or <code>SpatExtent</code>
<code>y</code>	If <code>x</code> is a <code>SpatRaster</code> , <code>y</code> should be a <code>SpatExtent</code> , or an object from which it can be extracted (such as <code>SpatRaster</code> and <code>SpatVector</code> objects). Alternatively, you can provide two positive integers indicating the number of rows and columns that need to be added at each side (or a single positive integer when the number of rows and columns is equal) If <code>x</code> is a <code>SpatExtent</code> , <code>y</code> should be a numeric vector of 1, 2, or 4 elements
<code>filename</code>	character. Output filename
<code>overwrite</code>	logical. If TRUE, <code>filename</code> is overwritten
<code>...</code>	additional arguments for writing files as in writeRaster

Value

`SpatRaster` or `SpatExtent`

See Also

[crop](#), [merge](#), [ext](#)

Examples

```
r <- rast(xmin=-150, xmax=-120, ymin=30, ymax=60, ncol=36, nrow=18)
values(r) <- 1:ncell(r)
e <- ext(-180, -100, 40, 70)
re <- expand(r, e)

# expand with a number of rows and columns (at each side)
re2 <- expand(r, c(2,10))
```

```
# SpatExtent
e <- ext(r)
e
expand(e, 10)
expand(e, c(10, -10, 0, 20))
```

ext *Create, get or set a SpatExtent*

Description

Get a SpatExtent of a SpatRaster, or coordinates from such an object. Or create a SpatExtent from a vector (length=4; order= xmin, xmax, ymin, ymax)

Usage

```
## S4 method for signature 'SpatRaster'
ext(x)

## S4 method for signature 'numeric'
ext(x, ...)

## S4 replacement method for signature 'SpatRaster,SpatExtent'
ext(x)<-value

## S4 replacement method for signature 'SpatRaster,numeric'
ext(x)<-value

## S4 method for signature 'SpatExtent'
x$name

## S4 replacement method for signature 'SpatExtent'
x$name<-value
```

Arguments

x	SpatRaster
value	SpatExtent, or numeric vector of length four (xmin, xmax, ymin, ymax), or a single number with the \$ method
name	character, one of xmin, xmax, ymin, or ymax
...	if x is a single numeric value, additional numeric values for xmax, ymin, and ymax

Value

SpatExtent

Examples

```

r <- rast()
e <- ext(r)
as.vector(e)
as.character(e)

ext(r) <- c(0, 2.5, 0, 1.5)
r
er <- ext(r)

round(er)
# go "in"
floor(er)
# go "out"
ceiling(er)

ext(r) <- e

```

extract

Extract values from a SpatRaster

Description

Extract values from a SpatRaster for a set of locations. The locations can be a SpatVector (points, lines, polygons), a matrix with (x, y) or (longitude, latitude – in that order!) coordinates, or a vector with cell numbers.

Usage

```

## S4 method for signature 'SpatRaster,SpatVector'
extract(x, y, fun=NULL, method="simple", list=FALSE, factors=TRUE,
        cells=FALSE, xy=FALSE, weights=FALSE, touches=is.lines(y), ...)

## S4 method for signature 'SpatRaster,matrix'
extract(x, y, ...)

## S4 method for signature 'SpatRaster,numeric'
extract(x, y, ...)

```

Arguments

x	SpatRaster
y	SpatVector (for points, lines, polygons), or for points, 2-column matrix or data.frame (x, y) or (lon, lat), or a vector with cell numbers
fun	function to summarize the data by geometry (e.g. polygon)

...	additional arguments to fun if y is a SpatVector or arguments passed to the SpatRaster, SpatVector method if y is a matrix (i.e., the method and cells arguments)
method	character. method for extracting values with points. The default is "simple", the alternative is "bilinear"
list	logical. If FALSE the output is simplified to a matrix (if fun=NULL)
factors	logical. If TRUE the categories are returned as factors instead of their numerical representation. The value returned becomes a data.frame if it otherwise would have been a matrix, even if there are no factors
cells	logical. If TRUE the cell numbers are also returned, unless fun is not NULL. Also see cells
xy	logical. If TRUE the coordinates of the cells are also returned, unless fun is not NULL. Also see xyFromCell
weights	logical. If TRUE and y has polygons, the fraction of each cell that is covered is returned as well, to compute a weighted mean. If fun is not NULL, the weighted mean is returned
touches	logical. If TRUE, values for all cells touched by lines or polygons are extracted, not just those on the line render path, or whose center point is within the polygon. Not relevant for points

Value

matrix, list, or data.frame

See Also

[values](#)

Examples

```
r <- rast(ncol=5, nrow=5, xmin=0, xmax=5, ymin=0, ymax=5)
values(r) <- 1:25
xy <- rbind(c(0.5,0.5), c(2.5,2.5))
p <- vect(xy, crs="+proj=longlat +datum=WGS84")

extract(r, xy)
extract(r, p)

r[1,]
r[5]
r[,5]

r[c(0:2, 99:101)]

f <- system.file("ex/test.tif", package="terra")
r <- rast(f)

xy <- cbind(179000, 330000)
xy <- rbind(xy-100, xy, xy+1000)
```

```

extract(r, xy)

p <- vect(xy)
g <- geom(p)
g

extract(r, p)

x <- r + 10
extract(x, p)

i <- cellFromXY(r, xy)
x[i]
r[i]

y <- c(x,x*2,x*3)
y[i]

## extract with a polygon
f <- system.file("ex/lux.shp", package="terra")
v <- vect(f)
v <- v[1:2,]
z <- rast(v, res=.1)
values(z) <- 1:ncell(z)
#e <- extract(z, v)
#e
#tapply(e[,2], e[,1], mean)

#ee <- extract(z, v, list=TRUE)
#rapply(ee, mean)

#x <- c(z, z*2, z/3)
#names(x) <- letters[1:3]

#e <- extract(x, v)
#de <- data.frame(e)
#aggregate(de[,2:4], de[,1,drop=FALSE], mean)

#ee <- extract(x, v, list=TRUE)
#matrix(rapply(ee, mean), ncol=nlyr(x), byrow=TRUE)

```

factors

Factors

Description

These functions allow for defining a `SpatRaster` layer as a categorical variable (factor). These can be inspected and set with `levels` and `cats`. These methods are the same except that with `levels<-` you can only set the categories of the first layer. Like factors in R, categories are stored as indices (integers) that have an associated label. In a `SpatRaster`, the index starts at 0, and cannot be larger

than 255. `as.factor` makes the first layer of a `SpatRaster` a categorical variable. You can then use `levels<-` to replace the labels.

The "Raster Attribute Table" (RAT) is similar in concept. A main difference with categories is that there can be many labels (variables) associated with one index. The RAT is a `data.frame`; the first column ("ID") has the unique cell values of the layer.

Usage

```
## S4 method for signature 'SpatRaster'
is.factor(x)

## S4 method for signature 'SpatRaster'
as.factor(x)

## S4 method for signature 'SpatRaster'
levels(x)

## S4 replacement method for signature 'SpatRaster'
levels(x)<-value

## S4 method for signature 'SpatRaster'
cats(x)

## S4 replacement method for signature 'SpatRaster'
cats(x, layer=1)<-value

## S4 method for signature 'SpatRaster'
rats(x)

## S4 replacement method for signature 'SpatRaster'
rats(x, layer=1)<-value
```

Arguments

<code>x</code>	<code>SpatRaster</code>
<code>layer</code>	positive integer, the layer number or name
<code>value</code>	With <code>cats<-</code> and <code>levels<-</code> this can be a character vectors with new labels or a two column <code>data.frame</code> . The first column is an integer cell value, and the second column is the character label. With <code>rats<-</code> this is a <code>data.frame</code> . The first column is an integer cell value, and any number and type of additional columns is allowed

Value

`SpatRaster`; list (e.g., `levels`); boolean (`is.factor`)

Examples

```
set.seed(0)
```

```

r <- rast(nrow=10, ncol=10)
values(r) <- sample(3, ncell(r), replace=TRUE) + 2
is.factor(r)

cls <- c("forest", "water", "urban")
levels(r) <- cls
names(r) <- "land cover"
is.factor(r)
r

f <- as.factor(r)

```

fill

Remove holes from polygons

Description

Remove the holes in SpatVector polygons. If `inverse=TRUE` the holes are returned (as polygons).

Usage

```

## S4 method for signature 'SpatVector'
fill(x, inverse=FALSE)

```

Arguments

<code>x</code>	SpatVector
<code>inverse</code>	logical. If TRUE the holes are returned as polygons

Value

SpatVector

Examples

```

x <- rbind(c(-10,0), c(140,60), c(160,0), c(140,-55))
hole <- rbind(c(80,0), c(105,13), c(120,2), c(105,-13))

z <- rbind(cbind(object=1, part=1, x, hole=0),
          cbind(object=1, part=1, hole, hole=1))
colnames(z)[3:4] <- c('x', 'y')
p <- vect(z, "polygons", atts=data.frame(id=1))
p

f <- fill(p)
g <- fill(p, inverse=TRUE)

plot(p, lwd=16, border="gray", col="light yellow")
polys(f, border="blue", lwd=3, density=4, col="orange")
polys(g, col="white", lwd=3)

```

flip *Flip or reverse a raster*

Description

Flip the values of a `SpatRaster` by inverting the order of the rows (`vertical=TRUE`) or the columns (`vertical=FALSE`).

`rev` is the same as a horizontal *and* a vertical flip.

Usage

```
## S4 method for signature 'SpatRaster'
flip(x, direction="vertical", filename="", ...)

## S4 method for signature 'SpatVector'
flip(x, direction="vertical")

## S4 method for signature 'SpatRaster'
rev(x)
```

Arguments

<code>x</code>	<code>SpatRaster</code> or <code>SpatVector</code>
<code>direction</code>	character. Should (partially) match "vertical" to flip by rows, or "horizontal" to flip by columns
<code>filename</code>	character. Output filename
<code>...</code>	additional arguments for writing files as in writeRaster

Value

`SpatRaster`

See Also

[transpose](#), [rotate](#)

Examples

```
r <- rast(nrow=18, ncol=36)
m <- matrix(1:ncell(r), nrow=18)
values(r) <- as.vector(t(m))
rx <- flip(r, direction="h")

values(r) <- as.vector(m)
ry <- flip(r, direction="v")

v <- rev(r)
```

focal	<i>Focal values</i>
-------	---------------------

Description

Calculate focal ("moving window") values for the neighborhood of focal cells using a matrix of weights, perhaps in combination with a function.

Usage

```
## S4 method for signature 'SpatRaster'
focal(x, w=3, na.rm=TRUE, na.only=FALSE, fillvalue=NA, fun="sum",
      filename="", ...)
```

Arguments

x	SpatRaster
w	window. The window can be defined as one (for a square) or two numbers (row, col); or with an odd-sized weights matrix . See Details. If w is a matrix, na.rm=FALSE and fun=sum, and cannot be changed
na.rm	logical. Should missing values be removed?
na.only	logical. Should only missing values in x be changed?
fillvalue	numeric. The value of the cells in the virtual rows and columns outside of the raster
fun	function that takes multiple numbers, and returns a single number. For example mean, modal, min or max. It should also accept a na.rm argument, either as actual argument or through use of ...
filename	character. Output filename
...	additional arguments for writing files as in writeRaster

Details

focal

The window used must have odd dimensions. If you need even sides, you can use a matrix and add a column or row with weights of zero.

Example weight matrices

Laplacian filter: `filter=matrix(c(0,1,0,1,-4,1,0,1,0),nrow=3)`

Sobel filter: `filter=matrix(c(1,2,1,0,0,0,-1,-2,-1) / 4,nrow=3)`

Value

SpatRaster

Examples

```

r <- rast(ncols=10, nrows=10, ext(0, 10, 0, 10))
values(r) <- 1:ncell(r)

#f <- focal(r, w=3, fun=function(x, ...) quantile(x, .25, ...), na.rm=TRUE)

f <- focal(r, w=3, fun="mean")

# the following two statements are equivalent:
a <- focal(r, w=matrix(1/9, nc=3, nr=3))
b <- focal(r, w=3, fun=mean, na.rm=FALSE)

# but this is different
d <- focal(r, w=3, fun=mean, na.rm=TRUE)

```

focalMat	<i>Focal weights matrix</i>
----------	-----------------------------

Description

Make a focal ("moving window") weight matrix for use in the `focal` function. The sum of the values adds up to one.

Usage

```
focalMat(x, d, type=c('circle', 'Gauss', 'rectangle'))
```

Arguments

x	SpatRaster
d	numeric. If type=circle, the radius of the circle (in units of the crs). If type=rectangle the dimension of the rectangle (one or two numbers). If type=Gauss the size of sigma, and optionally another number to determine the size of the matrix returned (default is 3*sigma)
type	character indicating the type of filter to be returned

Value

matrix that can be used with `focal`

Examples

```

r <- rast(ncol=180, nrow=180, xmin=0)
focalMat(r, 2, "circle")

focalMat(r, c(2,3), "rect")

# Gaussian filter for square cells
gf <- focalMat(r, 1, "Gauss")

```

freq	<i>Frequency table</i>
------	------------------------

Description

Frequency table of the values of a `SpatRaster`. NAs are not counted.

Usage

```
## S4 method for signature 'SpatRaster'  
freq(x, digits=0, value=NULL, bylayer=TRUE)
```

Arguments

x	<code>SpatRaster</code>
bylayer	logical. If TRUE tabulation is done by layer
digits	integer. Used for rounding the values before tabulation. Ignored if NA
value	numeric. An optional single value to only count the number of cells with that value

Value

matrix with 2 columns (value, count) or, if `bylayer=TRUE` three layers (layer, value, count).

See Also

[freq](#)

Examples

```
r <- rast(nrow=10, ncol=10)  
set.seed(2)  
values(r) <- sample(5, ncell(r), replace=TRUE)  
  
freq(r, FALSE)  
freq(r)  
  
x <- c(r, r/3)  
freq(x, FALSE)  
freq(x)  
freq(x, digits=1)  
freq(x, digits=-1)  
  
freq(x, value=5)
```

`gdal`*gdal utilities*

Description

Set the GDAL warning level or get a data.frame with the available GDAL drivers (file formats), or get the GDAL version (if warn=NA and drivers=FALSE, the default).

Usage

```
gdal(warn=NA, drivers=FALSE)
```

```
gdal_version()
```

Arguments

warn	ignored if NA. Otherwise, the value should be an integer between 1 and 4 representing the level of GDAL warnings and errors that are passed to R. 1 = warnings and errors; 2 = errors only (recoverable errors as a warning); 3 = irrecoverable errors only; 4 = ignore all errors and warnings. The default setting is 3
drivers	logical. If TRUE a data.frame with the raster and vector data formats that are available.

Value

character

See Also

[describe](#) for file-level metadata "GDALinfo"

Examples

```
gdal()
gdal(2)
head(gdal(drivers=TRUE))
```

geom

*Get the geometry (coordinates) of a SpatVector***Description**

Get the geometry of a SpatVector. If wkt=FALSE, this is a five-column matrix or data.frame: the vector object ID, the IDs for the parts of each object (e.g. five polygons that together are one spatial object), the x (longitude) and y (latitude) coordinates, and a flag indicating whether the part is a "hole" (only relevant for polygons).

If wkt=TRUE, the "well-known text" representation is returned as a character vector.

Usage

```
## S4 method for signature 'SpatVector'
geom(x, wkt=FALSE, df=FALSE)
```

Arguments

x	SpatVector
wkt	logical. If TRUE the WKT geometry is returned
df	logical. If TRUE a data.frame is returned in stead of a matrix (only for WKT=FALSE)

Value

matrix

See Also

See [xyFromCell](#) to get the coordinates of the cells of a SpatRaster

Examples

```
x1 <- rbind(c(-175,-20), c(-140,55), c(10, 0), c(-140,-60))
x2 <- rbind(c(-125,0), c(0,60), c(40,5), c(15,-45))
x3 <- rbind(c(-10,0), c(140,60), c(160,0), c(140,-55))
x4 <- rbind(c(80,0), c(105,13), c(120,2), c(105,-13))
z <- rbind(cbind(object=1, part=1, x1), cbind(object=2, part=1, x2),
          cbind(object=3, part=1, x3), cbind(object=3, part=2, x4))
colnames(z)[3:4] <- c('x', 'y')
z <- cbind(z, hole=0)
z[, "object"] == 3 & z[, "part"] == 2, "hole"] <- 1

p <- vect(z, "polygons")
geom(p)

f <- system.file("ex/lux.shp", package="terra")
v <- vect(f)
g <- geom(v)
```

```
head(g)

w <- geom(v, wkt=TRUE)
substr(w, 1, 60)
```

geomtype

Geometry type of a SpatVector

Description

Get the geometry type (points, lines, or polygons) of a SpatVector or the data types of the fields (attributes, variables) of a SpatVector.

Usage

```
## S4 method for signature 'SpatVector'
geomtype(x)

## S4 method for signature 'SpatVector'
datatype(x)

## S4 method for signature 'SpatVector'
is.points(x)

## S4 method for signature 'SpatVector'
is.lines(x)

## S4 method for signature 'SpatVector'
is.polygons(x)
```

Arguments

x SpatVector

Value

character

Examples

```
f <- system.file("ex/lux.shp", package="terra")
v <- vect(f)

geomtype(v)
is.polygons(v)
is.lines(v)
is.points(v)

names(v)
datatype(v)
```

global	<i>global statistics</i>
--------	--------------------------

Description

Compute global statistics, that is summarized values of an entire SpatRaster.

If x is very large global will fail, except when fun is one of "mean", "min", "max", or "sum".

You can compute a weighted mean or sum by providing a SpatRaster with weights.

Usage

```
## S4 method for signature 'SpatRaster'  
global(x, fun="mean", weights=NULL, ...)
```

Arguments

x	SpatRaster
fun	function to be applied to summarize the values by zone. Either as one of these character values: "max", "min", "mean", "sum", "range", "rms" (root mean square), "sd", "sdpop" (population sd, using n rather than n-1); or, for relatively small SpatRasters, a proper function
...	additional arguments passed on to fun
weights	NULL or SpatRaster

Value

A data.frame with a row for each layer

See Also

[zonal](#) for "zonal" statistics, and [app](#) or [Summary-methods](#) for "local" statistics, and [extract](#) for summarizing values for polygons. Also see [focal](#) for "focal" or "moving window" operations.

Examples

```
r <- rast(ncols=10, nrows=10)  
values(r) <- 1:ncell(r)  
global(r, "sum")  
global(r, "mean", na.rm=TRUE)
```

head and tail	<i>Show the head or tail of a Spat* object</i>
---------------	--

Description

Show the head (first values) or tail (last values) of a SpatRaster or of the attributes of a SpatVector.

Usage

```
head(x, ...)  
tail(x, ...)
```

Arguments

x	SpatRaster or SpatVector
...	additional arguments passed on to other methods

Value

matrix (SpatRaster) or data.frame (SpatVector)

See Also

[show](#), [geom](#)

Examples

```
r <- rast(nrow=25, ncol=25)  
values(r) <- 1:ncell(r)  
head(r)  
tail(r)
```

hist	<i>Histogram</i>
------	------------------

Description

Create a histogram of the values of a SpatRaster. For large datasets a sample of maxcell is used.

Usage

```
## S4 method for signature 'SpatRaster'  
hist(x, layer, maxcell=1000000, plot=TRUE, main, ...)
```

Arguments

x	SpatRaster
layer	integer (or character) to indicate layer number (or name). Can be used to subset the layers to plot in a multilayer SpatRaster
maxcell	integer. To regularly sample very large objects
plot	logical. Plot the histogram or only return the histogram values
main	character. Main title(s) for the plot. Default is the value of <code>names</code>
...	additional arguments. See hist

Value

This function is principally used for plotting a histogram, but it also returns an object of class "histogram" (invisibly if `plot=TRUE`).

See Also

[pairs](#), [boxplot](#)

Examples

```
r1 <- r2 <- rast(nrows=50, ncols=50)
values(r1) <- runif(ncell(r1))
values(r2) <- runif(ncell(r1))
rs <- r1 + r2
rp <- r1 * r2

opar <- par(no.readonly =TRUE)
par(mfrow=c(2,2))
plot(rs, main='sum')
plot(rp, main='product')
hist(rs)
a <- hist(rp)
a
x <- c(rs, rp, sqrt(rs))
hist(x)
par(opar)
```

ifelse

ifelse for SpatRasters

Description

Implementation of [ifelse](#) for SpatRasters. This method allows for a concise approach to what can otherwise be achieved with a combination of [classify](#), [mask](#), and [cover](#).

`ifelse` is an R equivalent to the `Con` method in ArcGIS (`arcpy`).

Usage

```
## S4 method for signature 'SpatRaster'
ifel(test, yes, no, filename="", ...)
```

Arguments

test	SpatRaster
yes	SpatRaster or numeric
no	SpatRaster or numeric
filename	character. Output filename
...	additional arguments for writing files as in writeRaster

Value

SpatRaster

Examples

```
r <- rast(nrows=5, ncols=5, xmin=0, xmax=1, ymin=0, ymax=1)
values(r) <- c(-10:0, NA, NA, NA, 0:10)

x <- ifel(r > 1, 1, r)
# same as
a <- classify(r, cbind(1, Inf, 1))
# or
b <- app(r, fun=function(i) {i[i > 1] <- 1; i})
# or
d <- clamp(r, -Inf, 1)
# or (not recommended for large datasets)
e <- r
e[e>1] <- 1

## other examples
f <- ifel(is.na(r), 100, r)

z <- ifel(r > -2 & r < 2, 100, 0)

# nested expressions
y <- ifel(r > 1, 1, ifel(r < -1, -1, r))

k <- ifel(r > 0, r+10, ifel(r < 0, r-10, 3))
```

image	<i>SpatRaster image method</i>
-------	--------------------------------

Description

Plot (make a map of) the values of a `SpatRaster` via `image`. See `plot` if you need more fancy options such as a legend.

Usage

```
## S4 method for signature 'SpatRaster'
image(x, y=1, maxcell=50000, ...)
```

Arguments

x	<code>SpatRaster</code>
y	positive integer indicating the layer to be plotted, or a character indicating the name of the layer
maxcell	positive integer. Maximum number of cells to use for the plot
...	additional arguments as for <code>graphics::image</code>

See Also

[plot](#)

Examples

```
f <- system.file("ex/elev.tif", package="terra")
r <- rast(f)
image(r)
image(r, col=rainbow(24))
```

initialize	<i>Initialize a SpatRaster with values</i>
------------	--

Description

Create a `SpatRaster` with values reflecting a cell property: `'x'`, `'y'`, `'col'`, `'row'`, `'cell'` or `'chess'`. Alternatively, a function can be used. In that case, cell values are initialized without reference to pre-existing values. E.g., initialize with a random number (`fun=runif`). While there are more direct ways of achieving this for small objects (see examples) for which a vector with all values can be created in memory, the `init` function will also work for `SpatRaster` objects with many cells.

Usage

```
## S4 method for signature 'SpatRaster'
init(x, fun, filename="", ...)
```

Arguments

x	SpatRaster
fun	function to be applied. This must be either a single number, a function, or one of a set of character values. A function must take the number of cells as a single argument to return a vector of values with a length equal to the number of cells, such as fun=runif. Allowed character values are 'x', 'y', 'row', 'col', 'cell', and 'chess' to get the x or y coordinate, row, col or cell number or a chessboard pattern (alternating 0 and 1 values)
filename	character. Output filename
...	additional arguments for writing files as in writeRaster

Value

SpatRaster

Examples

```
r <- rast(ncol=10, nrow=5, xmin=0, xmax=10, ymin=0, ymax=5)
x <- init(r, fun="cell")
y <- init(r, fun=runif)

# initialize with a single value
z <- init(r, fun=8)
```

inset

Make an inset map

Description

Make an inset map

Usage

```
## S4 method for signature 'SpatVector'
inset(x, e, loc="", scale=0.2, background="white", border="black", box=NULL, pbx, ...)

## S4 method for signature 'SpatRaster'
inset(x, e, loc="", scale=0.2, background="white", border="black", box=NULL, pbx, ...)
```

Arguments

x	SpatVector, SpatRaster
e	SpatExtent to set the size and location of the inset. Or missing
loc	character. One of "bottomright", "bottom", "bottomleft", "left", "topleft", "top", "topright", "right", "center"
scale	numeric. The relative size of the inset, used when x is missing
background	color for the background of the inset. Use NA for no background color
border	color for the border around the inset. Use NA for no border
box	SpatExtent or missing, to draw a box on the inset
pbx	list with graphical arguments for the box
...	additional arguments passed to plot for the drawing of x

Value

scaled and shifted SpatVector or SpatRaster (invisibly)

See Also

[sbar](#), [rescale](#), [shift](#)

Examples

```
f <- system.file("ex/lux.shp", package="terra")
v <- vect(f)
x <- v[v$NAME_2 == "Diekirch", ]

plot(x, density=10, col="blue")
inset(v)

cols <- rep("light grey", 12)
cols[2] <- "red"
e <- ext(c(6.2, 6.3, 49.9, 50))
b <- ext(x)+0.02
inset(v, e=e, col=cols, box=b)

# with a SpatRaster
ff <- system.file("ex/elev.tif", package="terra")
r <- rast(ff)
r <- crop(r, ext(x) + .01)
plot(r, type="int", mar=c(2,2,2,2), plg=list(x="topright"))
lines(v, lwd=1.5)
lines(x, lwd=2.5)
inset(v, col=cols, loc="topleft", scale=0.15)

# a more complex one
plot(r, plg=list(title="meter\n", shrink=.2, cex=.8))
lines(v, lwd=4, col="white")
```

```

lines(v, lwd=1.5)
lines(x, lwd=2.5)
text(x, "NAME_2", cex=1.5, halo=TRUE)
sbar(6, c(6.04, 49.785), type="bar", below="km", label=c(0,3,6), cex=.8)
s <- inset(v, col=cols, box=b, scale=.2, loc="topright", background="light yellow",
pbx=list(lwd=2, lty=5, col="blue"))

# note the returned inset SpatVector
s

```

interpolate

Interpolate

Description

Make a `SpatRaster` with interpolated values using a fitted model object of classes such as "gstat" (gstat package) or "Krige" (fields package). That is, these are models that have location ("x" and "y", or "longitude" and "latitude") as independent variables. If x and y are the only independent variables provide an empty (no associated data in memory or on file) `SpatRaster` for which you want predictions. If there are more spatial predictor variables provide these as a `SpatRaster` in the first argument of the function. If you do not have x and y locations as implicit predictors in your model you should use `predict` instead.

Usage

```

## S4 method for signature 'SpatRaster'
interpolate(object, model, fun=predict, ...,
            xyNames=c("x", "y"), factors=NULL, const=NULL, index = NULL,
            na.rm=FALSE, filename="", overwrite=FALSE, wopt=list())

```

Arguments

object	<code>SpatRaster</code>
model	model object
fun	function. Default value is "predict", but can be replaced with e.g. "predict.se" (depending on the class of model)
...	additional arguments passed to fun
xyNames	character. variable names that the model uses for the spatial coordinates. E.g., c("longitude", "latitude")
factors	list with levels for factor variables. The list elements should be named with names that correspond to names in object such that they can be matched. This argument may be omitted for many models as the predict function will extract the levels from the model object

const	data.frame. Can be used to add a constant for which there is no SpatRaster for model predictions. This is particularly useful if the constant is a character-like factor value
index	positive integer or NULL. Allows for selecting of the variable returned if the model returns multiple variables
na.rm	logical. If TRUE, cells with NA values in the predictors are removed from the computation. This option prevents errors with models that cannot handle NA values. In most other cases this will not affect the output. An exception is when predicting with a model that returns predicted values even if some (or all!) variables are NA
filename	character. Output filename
overwrite	logical. If TRUE, filename is overwritten
wopt	list with named options for writing files as in writeRaster

Value

SpatRaster

See Also[predict](#)**Examples**

```

r <- rast(system.file("ex/test.tif", package="terra"))
ra <- aggregate(r, 10)
xy <- data.frame(xyFromCell(ra, 1:ncell(ra)))
v <- values(ra)
i <- !is.na(v)
xy <- xy[i,]
v <- v[i]

#library(fields)
#tps <- Tps(xy, v)
#p <- rast(r)

## use model to predict values at all locations
#p <- interpolate(p, tps)
#p <- mask(p, r)
#plot(p)

### change "fun" from predict to fields::predictSE to get the TPS standard error
## need to use "rast(p)" to remove the values
#se <- interpolate(rast(p), tps, fun=predictSE)
#se <- mask(se, r)
#plot(se)

### another variable; let's call it elevation

```

```

#elevation <- (init(r, 'x') * init(r, 'y')) / 100000000
#names(elevation) <- 'elev'

#z <- as.matrix(extract(elevation, xy))

## add as another independent variable
#xyz <- cbind(xy, z)
#tps2 <- Tps(xyz, v)
#p2 <- interpolate(elevation, tps2, xyOnly=FALSE)

## as a linear coveriate
#tps3 <- Tps(xy, v, Z=z)

## Z is a separate argument in Krig.predict, so we need a new function
## Internally (in interpolate) a matrix is formed of x, y, and elev (Z)

#pfun <- function(model, x, ...) {
#  predict(model, x[,1:2], Z=x[,3], ...)
#}
#p3 <- interpolate(elevation, tps3, fun=pfun)

#plot(coV, coV.fit, main='Fitted Co-variogram')
#coK <- interpolate(r, coV.fit, debug.level=0)
#plot(coK)
```

intersect

Intersection

Description

Intersect the geometries of two `SpatVectors`.

Intersecting points with points uses the extent of `y` to get the intersection. Intersecting of points and lines is not supported because of numerical inaccuracies with that. You can use [buffer](#), to create polygons from lines and use these with `intersect`.

See [crop](#) for intersection of a `SpatRaster`.

Usage

```
## S4 method for signature 'SpatVector,SpatVector'
intersect(x, y)
```

```
## S4 method for signature 'SpatVector,SpatExtent'
intersect(x, y)
```

```
## S4 method for signature 'SpatExtent,SpatVector'
intersect(x, y)
```

```
## S4 method for signature 'SpatExtent,SpatExtent'
intersect(x, y)
```

Arguments

<code>x</code>	<code>SpatVector</code> or <code>SpatExtent</code>
<code>y</code>	<code>SpatVector</code> or <code>SpatExtent</code>

Value

Same as `x`

See Also

[union](#), [crop](#), [relate](#)

Examples

```
e1 <- ext(-10, 10, -20, 20)
e2 <- ext(0, 20, -40, 5)
intersect(e1, e2)

#f <- system.file("ex/lux.shp", package="terra")
#v <- vect(f)
#e <- ext(5.6, 6, 49.55, 49.7)
#x <- intersect(v, e)

#p <- vect(c("POLYGON ((5.8 49.8, 6 49.9, 6.15 49.8, 6 49.6, 5.8 49.8))",
#"POLYGON ((6.3 49.9, 6.2 49.7, 6.3 49.6, 6.5 49.8, 6.3 49.9))"), crs=crs(v))
#values(p) <- data.frame(pid=1:2, area=area(p))

#y <- intersect(v, p)
```

is.lonlat

Check for longitude/latitude crs

Description

Test whether a `SpatRaster` or `SpatVector` has a longitude/latitude coordinate reference system (CRS), or perhaps has one. That is when the CRS is unknown ("") but the x coordinates are within -181 and 181 and the y coordinates are within -90.1 and 90.1. For a `SpatRaster` you can also test if it is longitude/latitude and "global" (covers all longitudes).

The form `isLonLat` is deprecated. Use `is.lonlat`

Usage

```
## S4 method for signature 'SpatRaster'
is.lonlat(x, perhaps=FALSE, warn=TRUE, global=FALSE)

## S4 method for signature 'SpatVector'
is.lonlat(x, perhaps=FALSE, warn=TRUE)

## S4 method for signature 'SpatRaster'
isLonLat(x)

## S4 method for signature 'SpatVector'
isLonLat(x)
```

Arguments

x	<code>SpatRaster</code> or <code>SpatVector</code>
perhaps	logical. If TRUE and the crs is unknown, the method returns TRUE if the coordinates are plausible for longitude/latitude

warn	logical. If TRUE, a warning is given if the CRS is unknown or when the CRS is longitude/latitude but the coordinates do not match that
global	logical. If TRUE, the method tests if the raster covers all longitudes (from -180 to 180 degrees) such that the extreme columns are in fact adjacent

Value

logical

Examples

```
r <- rast()
is.lonlat(r)
is.lonlat(r, global=TRUE)

crs(r) <- ""
is.lonlat(r)
is.lonlat(r, perhaps=TRUE, warn=FALSE)

crs(r) <- "+proj=lcc +lat_1=48 +lat_2=33 +lon_0=-100 +ellps=WGS84"
is.lonlat(r)
```

is.valid	<i>Check polygon validity</i>
----------	-------------------------------

Description

Check the validity of polygons

Usage

```
## S4 method for signature 'SpatVector'
is.valid(x, messages=FALSE)
```

Arguments

x	SpatVector
messages	logical. If TRUE the error messages are returned

Value

logical

Examples

```
w <- vect("POLYGON ((0 -5, 10 0, 10 -10, 0 -5))")
is.valid(w)

w <- vect("POLYGON ((0 -5, 10 0, 10 -10, 4 -2, 0 -5))")
is.valid(w)
is.valid(w, TRUE)

plot(w)
points(cbind(4.54, -2.72), cex=2, col="red")

# this gives an error
#w <- vect("POLYGON ((0 -5, 10 0, 10 -10, 4 -2))")
#is.valid(w)
```

lapp

Apply a function to layers of a SpatRaster, or to sub-datasets of a SpatRasterDataset

Description

Apply a function to layers of a SpatRaster ("overlay").

The number of arguments in function `fun` must match the number of layers in the SpatRaster (or the number of sub-datasets in the SpatRasterDataset). For example, if you want to multiply two layers, you could use this function : `fun=function(x,y){return(x*y)}` percentage: `fun=function(x,y){return(100 * x / y)}`. If you combine three layers you could use `fun=function(x,y,z){return((x + y) * z)}`

Before you use the function, test it to make sure that it works for vectors (not only for single numbers). That is, it must return the same number of elements as its input vectors, or multiples of that. Make sure it also returns the same number of values when some or all input values are NA. Also, the function must return a vector or matrix, not a `data.frame`.

Use [app](#) for summarize functions such as `sum`, that take any number of arguments; and [tapp](#) to so for groups of layers.

Usage

```
## S4 method for signature 'SpatRaster'
lapp(x, fun, ..., usenames=FALSE, filename="", overwrite=FALSE, wopt=list())

## S4 method for signature 'SpatRasterDataset'
lapp(x, fun, ..., recycle=FALSE, filename="", overwrite=FALSE, wopt=list())
```

Arguments

<code>x</code>	SpatRaster or SpatRasterDataset
<code>fun</code>	function to be applied

...	additional arguments to be passed to fun
usenames	logical. Use the layer names to match the function arguments? If FALSE matching is by position
recycle	logical. Recycle layers to match the subdataset with the largest number of layers
filename	character. Output filename
overwrite	logical. If TRUE, filename is overwritten
wopt	list with named options for writing files as in writeRaster

Value

SpatRaster

See Also[app](#), [tapp](#), [math](#)**Examples**

```
s <- rast(system.file("ex/logo.tif", package="terra"))
ss <- s[[2:1]]

fvi <- function(x, y){ (x - y) / (x + y) }
x <- lapp(ss, fun=fvi )

# which is the same as supplying the layers to "fun"
# in some cases this will be much faster
y <- fvi(s[[2]], s[[1]])

f2 <- function(x, y, z){ (z - y + 1) / (x + y + 1) }
p1 <- lapp(s, fun=f2 )

p2 <- lapp(s[[1:2]], f2, z=200)

# the usenames argument

fvi2 <- function(red, green){ (red - green) / (red + green) }
names(s)
x1 <- lapp(s[[1:2]], fvi2, usenames=TRUE)
x2 <- lapp(s[[2:1]], fvi2, usenames=TRUE)
# x1 and x2 are the same, despite the change in the order of the layers
# x4 is also the same, but x3 is not
x3 <- lapp(s[[2:1]], fvi2, usenames=FALSE)
x4 <- lapp(s, fvi2, usenames=TRUE)

# while this would give an error because
# there are too many layers in s
# x5 <- lapp(s, fvi2, usenames=FALSE)

pairs(c(x1, x2, x3, x4))
```

```
## SpatRasterDataset
x <- sds(s, s[[1]]+50)
lapp(x, function(x, y) x/y, recycle=TRUE)
```

linearUnits

Linear units of the coordinate reference system

Description

Get the linear units of the coordinate reference system (crs) of a SpatRaster or SpatVector expressed in m. The value returned is used internally to transform area and perimeter measures to meters. The value returned for longitude/latitude crs is zero.

Usage

```
## S4 method for signature 'SpatRaster'
linearUnits(x)

## S4 method for signature 'SpatVector'
linearUnits(x)
```

Arguments

x SpatRaster or SpatVector

Value

numeric (meter)

See Also

[crs](#)

Examples

```
x <- rast()
crs(x) <- ""
linearUnits(x)

crs(x) <- "+proj=longlat +datum=WGS84"
linearUnits(x)

crs(x) <- "+proj=utm +zone=1 +units=cm"
linearUnits(x)

crs(x) <- "+proj=utm +zone=1 +units=km"
linearUnits(x)
```

```
crs(x) <- "+proj=utm +zone=1 +units=us-ft"
linearUnits(x)
```

lines *Add SpatVector data to a map*

Description

Add SpatVector data to a plot (map) with points, lines, or polys.

These are simpler alternatives for [plot\(x, add=TRUE\)](#)

Usage

```
## S4 method for signature 'SpatVector'
points(x, col, cex=1, pch=20, ...)

## S4 method for signature 'SpatVector'
lines(x, y=NULL, col, lwd=1, lty=1, arrows=FALSE, ...)

## S4 method for signature 'SpatVector'
polys(x, col, border="black", lwd=1, lty=1, ...)

## S4 method for signature 'SpatExtent'
points(x, col, ...)

## S4 method for signature 'SpatExtent'
lines(x, col, ...)
```

Arguments

x	SpatVector or SpatExtent
y	missing or SpatVector. If both x and y have point geometry and the same number of rows, lines are drawn between pairs of points
col	character. Colors
border	character. color(s) of the polygon borders. Use NULL or NA to not draw a border
cex	numeric. point size magnifier. See par
pch	positive integer, line type. See points
lwd	numeric, line-width. See par
lty	positive integer, line type. See par
arrows	logical. If TRUE and y is a SpatVector, arrows are drawn instead of lines. See ?arrows for additional arguments
...	additional graphical arguments such as lwd, cex and pch

Examples

```
f <- system.file("ex/lux.shp", package="terra")
v <- vect(f)

r <- rast(v)
values(r) <- 1:ncell(r)
plot(r)
lines(v)
points(v)
```

mask

Mask values in a SpatRaster

Description

Create a new SpatRaster that has the same values as SpatRaster *x*, except for the cells that are NA (or another maskvalue) in another SpatRaster (the 'mask'), or not covered by a SpatVector. These cells become NA (or another updatevalue).

Usage

```
## S4 method for signature 'SpatRaster,SpatRaster'
mask(x, mask, inverse=FALSE, maskvalues=NA,
      updatevalue=NA, filename="", ...)

## S4 method for signature 'SpatRaster,SpatVector'
mask(x, mask, inverse=FALSE, updatevalue=NA,
      touches=is.lines(mask), filename="", ...)
```

Arguments

<i>x</i>	SpatRaster
<i>mask</i>	SpatRaster
<i>inverse</i>	logical. If TRUE, areas on mask that are <i>_not_</i> the maskvalue are masked
<i>maskvalues</i>	numeric. The value(s) in mask that indicates the cells of <i>x</i> that should become updatevalue (default = NA)
<i>updatevalue</i>	numeric. The value that cells of <i>x</i> should become if they are not covered by mask (and not NA)
<i>touches</i>	logical. If TRUE, all cells touched by lines or polygons will be masked, not just those on the line render path, or whose center point is within the polygon
<i>filename</i>	character. Output filename
<i>...</i>	additional arguments for writing files as in writeRaster

Value

SpatRaster

See Also[crop](#)**Examples**

```

r <- rast(ncol=10, nrow=10)
m <- rast(ncol=10, nrow=10)
values(r) <- 1:100
set.seed(1965)
x <- round(3 * runif(ncell(r)))
x[x==0] <- NA
values(m) <- x
mr <- mask(r, m)

```

match

*Value matching for SpatRasters***Description**

match returns a SpatRaster with the position of the matched values. The cell values are the index of the table argument.

%in% returns a 0/1 (FALSE/TRUE) SpatRaster indicating if the cells values were matched or not.

Usage

```
match(x, table, nomatch = NA_integer_, incomparables = NULL)
```

```
x %in% table
```

Arguments

x	SpatRaster
table	vector of the values to be matched against
nomatch	the value to be returned in the case when no match is found. Note that it is coerced to integer
incomparables	a vector of values that cannot be matched. Any value in x matching a value in this vector is assigned the nomatch value. For historical reasons, FALSE is equivalent to NULL

Value

SpatRaster

See Also[calc](#), [match](#)**Examples**

```
r <- rast(nrow=10, ncol=10)
values(r) <- 1:100
m <- match(r, c(5:10, 50:55))
n <- r %in% c(5:10, 50:55)
```

math

*Arithmetic, logical and general mathematical methods***Description**

Standard operators and mathematical methods for computations with `SpatRaster` objects. Computations are local (applied on a cell by cell basis). If multiple `SpatRaster` objects are used, these must have the same extent and resolution. These have been implemented:

Arith: `+`, `-`, `*`, `/`, `^`, `%%`, `/%`

Compare: `==`, `!=`, `>`, `<`, `<=`, `>=`, `is.na`, `is.nan`, `is.finite`, `is.infinite`

The terra package does not distinguish between NA (not available) and NaN (not a number). In most cases this state is represented by NaN.

Logical: `!`, `&`, `|`, `isTRUE`, `isFALSE`

Summary: `max`, `min`, `range`, `prod`, `sum`, `any`, `all`

Math: `abs`, `sign`, `sqrt`, `ceiling`, `floor`, `trunc`, `cummax`, `cummin`, `cumprod`, `cumsum`, `log`, `log10`, `log2`, `log1p`, `acos`, `acos`

The following methods have been implemented for **SpatExtent**: `round`, `floor`, `ceil`, `==`, for (**SpatExtent**, **SpatExtent**): `==`, `+`, `-`, and for (**SpatExtent**, **numeric**): `+`, `-`, `*`, `/`, `%%`

Usage

```
## S4 method for signature 'SpatRaster'
log(x, base=exp(1))
```

Arguments

<code>x</code>	<code>SpatRaster</code>
<code>base</code>	a positive or complex number: the base with respect to which logarithms are computed

Value

`SpatRaster` or `SpatExtent`

seealso

[ifel](#) to conveniently combine operations and [app](#) to use mathematical functions not implemented by the package.

Examples

```
r1 <- rast(ncols=10, nrows=10)
v <- runif(ncell(r1))
v[10:20] <- NA
values(r1) <- v
r2 <- rast(r1)
values(r2) <- 1:ncell(r2) / ncell(r2)
r3 <- r1 + r2
r2 <- r1 / 10
r3 <- r1 * (r2 - 1 / r2)
```

```
b <- c(r1, r2, r3)
b2 <- b * 10
s <- sqrt(b2)
round(s, 1)
```

```
max(s)
max(s, na.rm=TRUE)
```

```
x <- is.na(s)
```

```
y <- which.max(s)
```

```
### SpatExtent methods
x <- ext(0.1, 2.2, 0, 3)
y <- ext(-2, 1, -2,2)
# union
x + y
# intersection
x * y
```

```
e <- x
e
e * 2
e / 2
e + 1
e - 1
```

Description

Merge `SpatRasters` to form a new `SpatRaster` object with a larger spatial extent. If objects overlap, the values get priority in the same order as the arguments. See [classify](#) to merge a `SpatRaster` and a `data.frame`. You can also merge `SpatExtent` objects.

There is also a method for merging `SpatVector` with a `data.frame`; that is, to join the `data.frame` to the attribute table of the `SpatVector`.

Usage

```
## S4 method for signature 'SpatRaster,SpatRaster'
merge(x, y, ..., filename="", overwrite=FALSE, wopt=list())

## S4 method for signature 'SpatExtent,SpatExtent'
merge(x, y, ...)

## S4 method for signature 'SpatVector,data.frame'
merge(x, y, ...)
```

Arguments

<code>x</code>	<code>SpatRaster</code> or <code>SpatExtent</code>
<code>y</code>	object of same class as <code>x</code>
<code>...</code>	if <code>x</code> is a <code>SpatRaster</code> or <code>SpatVector</code> : additional objects of the same class as <code>x</code> . If <code>x</code> is a <code>SpatVector</code> , the same arguments as in merge
<code>filename</code>	character. Output filename
<code>overwrite</code>	logical. If TRUE, <code>filename</code> is overwritten
<code>wopt</code>	list with named options for writing files as in writeRaster

Details

The `SpatRaster` objects must have the same origin and spatial resolution. In areas where the `SpatRaster` objects overlap, the values of the `SpatRaster` that is last in the sequence of arguments will be retained.

Value

`SpatRaster` or `SpatExtent`

See Also

[mosaic](#)

Examples

```
x <- rast(xmin=-110, xmax=-50, ymin=40, ymax=70, ncols=60, nrows=30)
y <- rast(xmin=-80, xmax=-20, ymax=60, ymin=30)
res(y) <- res(x)
values(x) <- 1:ncell(x)
```

```

values(y) <- 1:ncell(y)
mr <- merge(x, y)
plot(mr)
mr <- merge(y, x)

# if you have many SpatRaster objects in a list
# you can use do.call:
s <- list(x, y)
# add arguments such as filename
s$filename <- ""
m <- do.call(merge, s)

##
# SpatVector with data.frame
f <- system.file("ex/lux.shp", package="terra")
p <- vect(f)
dfr <- data.frame(District=p$NAME_1, Canton=p$NAME_2, Value=round(runif(length(p), 100, 1000)))
dfr <- dfr[1:5, ]
pm <- merge(p, dfr, all.x=TRUE, by.x=c('NAME_1', 'NAME_2'), by.y=c('District', 'Canton'))
pm
values(pm)

```

modal

modal value

Description

Compute the mode for each cell across the layers of a SpatRaster. The mode, or modal value, is the most frequent value in a set of values.

Usage

```

## S4 method for signature 'SpatRaster'
modal(x, ..., ties="first", na.rm=FALSE, filename="", overwrite=FALSE, wopt=list())

```

Arguments

x	SpatRaster
...	additional argument of the same type as x or numeric
ties	character. Indicates how to treat ties. Either "random", "lowest", "highest", "first", or "NA"
na.rm	logical. If TRUE, NA values are ignored. If FALSE, NA is returned if x has any NA values
filename	character. Output filename
overwrite	logical. If TRUE, filename is overwritten
wopt	list with named options for writing files as in writeRaster

Value

SpatRaster

Examples

```
r <- rast(system.file("ex/logo.tif", package="terra"))
r <- c(r/2, r, r*2)
m <- modal(r)
```

mosaic

*mosaic SpatRasters***Description**

mosaic SpatRasters to form a new SpatRaster object with a larger spatial extent. Unlike with [merge](#), values on overlapping areas are averaged.

Usage

```
## S4 method for signature 'SpatRaster,SpatRaster'
mosaic(x, y, ..., fun="mean", filename="", overwrite=FALSE, wopt=list())
```

Arguments

x	SpatRaster
y	object of same class as x
...	additional SpatRasters
fun	character. One of "sum", "mean", "median", "min", "max"
filename	character. Output filename
overwrite	logical. If TRUE, filename is overwritten
wopt	list with named options for writing files as in writeRaster

Details

The SpatRaster objects must have the same origin and spatial resolution. In areas where the SpatRaster objects overlap, the values of the SpatRaster that is last in the sequence of arguments will be retained.

Value

SpatRaster

See Also[merge](#)

Examples

```
x <- rast(xmin=-110, xmax=-50, ymin=40, ymax=70, ncols=60, nrows=30)
y <- rast(xmin=-80, xmax=-20, ymax=60, ymin=30)
res(y) <- res(x)
values(x) <- 1:ncell(x)
values(y) <- 1:ncell(y)
mr <- mosaic(x, y)
```

NAflag*Set a value to NA*

Description

Set a particular value of a SpatRaster to NA. If the values are in memory the change is made immediately. If the values are on disk, the changes is only made for values read from the file ("lazy evaluation").

Usage

```
## S4 method for signature 'SpatRaster'
NAflag(x)

## S4 replacement method for signature 'SpatRaster'
NAflag(x)<-value
```

Arguments

x	SpatRaster
value	numeric. The value to be interpreted as NA; set this before reading the values from the file. This can be a single value, or multiple values, one for each data source (file / subdataset)

Value

none or numeric

Examples

```
s <- rast(system.file("ex/logo.tif", package="terra"))[[1]]
NAflag(s) <- 255
plot(s)
NAflag(s)
```

names	<i>Names of Spat* objects</i>
-------	-------------------------------

Description

Get or set the names of the layers of a `SpatRaster` or the attributes of a `SpatVector`. With `lnames` you can get or set the "long names" of a `SpatRaster` or `SpatRasterDataset`.

For a `SpatRaster`, you can also get/set a variable name or long name (one per data source)

Usage

```
## S4 method for signature 'SpatRaster'
names(x)

## S4 replacement method for signature 'SpatRaster'
names(x)<-value

## S4 method for signature 'SpatRaster'
varnames(x)

## S4 replacement method for signature 'SpatRaster'
varnames(x)<-value

## S4 method for signature 'SpatRaster'
longnames(x)

## S4 replacement method for signature 'SpatRaster'
longnames(x)<-value

## S4 method for signature 'SpatRasterDataset'
names(x)

## S4 replacement method for signature 'SpatRasterDataset'
names(x)<-value

## S4 method for signature 'SpatRasterDataset'
varnames(x)

## S4 replacement method for signature 'SpatRasterDataset'
varnames(x)<-value

## S4 method for signature 'SpatRasterDataset'
longnames(x)

## S4 replacement method for signature 'SpatRasterDataset'
```

```
longnames(x)<-value

## S4 method for signature 'SpatVector'
names(x)

## S4 replacement method for signature 'SpatVector'
names(x)<-value
```

Arguments

x	SpatRaster, SpatRasterDataset, or SpatVector
value	character (vector)

Value

character

Note

terra enforces neither unique nor valid names. See [make.unique](#) to create unique names and `{make.names}` to make syntactically valid names.

Examples

```
s <- rast(ncols=5, nrows=5, nlyr=3)
nlyr(s)
names(s)
names(s) <- c("a", "b", "c")
names(s)

# space is not valid
names(s)[2] <- "hello world"
names(s)

# two invalid names
names(s) <- c("a", " a ", "3")
names(s)

# SpatVector names
f <- system.file("ex/lux.shp", package="terra")
v <- vect(f)
names(v)
names(v) <- paste0(substr(names(v), 1, 2), "_", 1:ncol(v))
names(v)
```

near	<i>nearby geometries</i>
------	--------------------------

Description

Identify geometries that are near to each other. Either get the index of all geometries within a certain distance, or get the k nearest neighbors.

Usage

```
## S4 method for signature 'SpatVector'  
near(x, distance=0, k=1, centroids=TRUE, symmetrical=TRUE)
```

Arguments

x	SpatVector
distance	numeric. maximum distance
k	positive integer. number of neighbors. Ignored if distance > 0
centroids	logical. Should the centroids of polygons be used?
symmetrical	logical. If TRUE, a near pair is only included once. That is, if geometry 1 is near to geometry 3, the implied nearness between 3 and 1 is not reported

Value

matrix

See Also

[relate](#), [adjacent](#)

Examples

```
f <- system.file("ex/lux.shp", package="terra")  
v <- vect(f)  
near(v, distance=12000)
```

options

Options

Description

Class and methods for showing and setting general options for terra.

Usage

```
terraOptions(...)
```

Arguments

... option names and values (see Details). Or missing, to show the current options

Details

The following options are available.

memfrac - value between 0.1 and 0.9 (larger values give a warning). The fraction of RAM that may be used by the program.

tempdir - directory where temporary files are written. The default what is returned by tempdir().

datatype - default data type. See [writeRaster](#)

todisk - logical. If TRUE write all raster data to disk (temp file if no file name is specified). For debugging.

progress - non-negative integer. A progress bar is shown if the number of chunks in which the data is processed is larger than this number. No progress bar is shown if the value is zero

verbose - logical. If TRUE debugging info is printed for some functions

Examples

```
terraOptions()  
terraOptions(memfrac=0.5, tempdir = "c:/temp")  
terraOptions(progress=10)  
terraOptions()
```

origin	<i>Origin</i>
--------	---------------

Description

Origin returns the coordinates of the point of origin of a SpatRaster object. This is the point closest to (0, 0) that you could get if you moved towards that point in steps of the x and y resolution.

Usage

```
## S4 method for signature 'SpatRaster'
origin(x)
```

Arguments

x SpatRaster

Value

A vector of two numbers (x and y coordinates)

Examples

```
r <- rast(xmin=-0.5, xmax = 9.5, ncols=10)
origin(r)
```

pack	<i>pack a SpatRaster or SpatVector object</i>
------	---

Description

Pack a SpatRaster or SpatVector object so that it can be saved as an R object to disk, or passed over a connection that serializes (e.g. using a computer cluster).

Usage

```
## S4 method for signature 'SpatRaster'
pack(x)

## S4 method for signature 'SpatVector'
pack(x)
```

Arguments

x SpatVector or SpatRaster

Value

Packed* object

Examples

```
f <- system.file("ex/lux.shp", package="terra")
v <- vect(f)
p <- pack(v)
P
vv <- vect(p)
vv
```

pairs	<i>Pairs plot (matrix of scatterplots)</i>
-------	--

Description

Pair plots of layers in a `SpatRaster`. This is a wrapper around graphics function `pairs`.

Usage

```
## S4 method for signature 'SpatRaster'
pairs(x, hist=TRUE, cor=TRUE, use="pairwise.complete.obs", maxcells=100000, ...)
```

Arguments

x	SpatRaster
hist	logical. If TRUE a histogram of the values is shown on the diagonal
cor	logical. If TRUE the correlation coefficient is shown in the upper panels
use	argument passed to the <code>cor</code> function
maxcells	integer. Number of pixels to sample from each layer of a large <code>SpatRaster</code>
...	additional arguments (graphical parameters)

See Also

[boxplot](#), [hist](#)

Examples

```
r <-rast(system.file("ex/elev.tif", package="terra"))
s <- c(r, 1/r, sqrt(r))
names(s) <- c("elevation", "inverse", "sqrt")
pairs(s)

# to make individual histograms:
hist(r)
# or scatter plots:
plot(s[[1]], s[[2]])
```

persp	<i>Perspective plot</i>
-------	-------------------------

Description

Perspective plot of a SpatRaster. This is an implementation of a generic function in the graphics package.

Usage

```
## S4 method for signature 'SpatRaster'
persp(x, maxcells=100000, ...)
```

Arguments

x	SpatRaster. Only the first layer is used
maxcells	integer > 0. Maximum number of cells to use for the plot. If maxpixels < ncell(x), spatSample(method="regular") is used before plotting
...	Any argument that can be passed to persp (graphics package)

See Also

[persp](#), [contour](#), [plot](#)

Examples

```
r <- rast(system.file("ex/elev.tif", package="terra"))
persp(r)
```

plot	<i>Make a map</i>
------	-------------------

Description

Plot the values of a SpatRaster or SpatVector to make a map. See [lines](#) to add a SpatVector to an existing map.

Usage

```
## S4 method for signature 'SpatRaster,numeric'
plot(x, y=1, col, type, mar=NULL, legend=TRUE, axes=TRUE, plg=list(),
     pax=list(), maxcell=50000, smooth=FALSE, range=NULL, levels=NULL, fun=NULL,
     colNA=NULL, alpha=NULL, ...)

## S4 method for signature 'SpatRaster,missing'
plot(x, y, maxcell=50000, main, mar=NULL, nc, nr, maxnl=16, ...)

## S4 method for signature 'SpatVector,character'
plot(x, y, col, type, mar=NULL, legend=TRUE,
     add=FALSE, axes=!add, main=y,
     plg=list(), pax=list(), nr, nc, ...)

## S4 method for signature 'SpatVector,numeric'
plot(x, y, ...)

## S4 method for signature 'SpatVector,missing'
plot(x, y, ...)

## S4 method for signature 'SpatExtent,missing'
plot(x, y, ...)
```

Arguments

x	SpatRaster or SpatVector
y	missing or positive integer or name indicating the layer(s) to be plotted
col	character. Colors
type	character. Type of map/legend. One of "continuous", "classes", or "interval"
mar	numeric vector of length 4 to set the margins of the plot (to make space for the legend). The default is (3.1, 3.1, 2.1, 7.1) for a single plot with a legend and (3.1, 3.1, 2.1, 2.1) otherwise. Use mar=NA to not set the margins
legend	logical. Draw a legend?
axes	logical. Draw axes?
plg	list with parameters for drawing the legend. See the arguments for legend
pax	list with parameters for drawing axes. See the arguments for axis
maxcell	positive integer. Maximum number of cells to use for the plot
smooth	logical. If TRUE the cell values are smoothed (for continuous legend)
range	numeric. minimum and maximum values to be used for the continuous legend
levels	character. labels to be used for the classes legend
fun	function to be called after plotting each SpatRaster layer to add something to each map (such as text, legend, lines). For example, with SpatVector v, you could do fun=function() lines(v). The function may have one argument, representing the the layer that is plotted (1 to the number of layers)

colNA	character. color for the NA values
alpha	numeric between 0 and 1 to set the transparency for all colors (0 is transparent, 1 is opaque)
nc	positive integer. Optional. The number of columns to divide the plotting device in (when plotting multiple layers)
nr	positive integer. Optional. The number of rows to divide the plotting device in (when plotting multiple layers)
main	character. Main plot titles (one for each layer to be plotted)
maxnl	positive integer. Maximum number of layers to plot (for a multi-layer object)
add	logical. If TRUE add the object to the current plot
...	arguments passed to <code>plot("SpatRaster", "numeric")</code> and additional graphical arguments

See Also

plg=list(legend=c("<200", "200-250", ">250"), cex=1,
bty="o", x=6.4, y=50.125, box.lwd=2, bg="light yellow", title="My Legend"))

```

plotRGB

Red-Green-Blue plot of a multi-layered SpatRaster

Description

Make a Red-Green-Blue plot based on three layers in a `SpatRaster`. The layers (sometimes referred to as "bands" because they may represent different bandwidths in the electromagnetic spectrum) are combined such that they represent the red, green and blue channel. This function can be used to make "true" (or "false") color images from Landsat and other multi-spectral satellite images.

Usage

```

## S4 method for signature 'SpatRaster'
plotRGB(x, r=1, g=2, b=3, scale, maxcell=500000, mar=0, stretch=NULL,
ext=NULL, interpolate=FALSE, colNA="white", alpha, bgamma, addfun=NULL, zlim=NULL,
zlimcol=NULL, axes=FALSE, xlab="", ylab="", asp=NULL, add=FALSE, ...)

```

Arguments

x	SpatRaster
r	integer. Index of the Red channel, between 1 and nlyr(x)
g	integer. Index of the Green channel, between 1 and nlyr(x)
b	integer. Index of the Blue channel, between 1 and nlyr(x)
scale	integer. Maximum (possible) value in the three channels. Defaults to 255 or to the maximum value of x if that is known and larger than 255
maxcell	integer > 0. Maximum number of pixels to use
mar	numeric vector recycled to length 4 to set the margins of the plot. Use mar=NULL or mar=NA to not set the margins
stretch	character. Option to stretch the values to increase the contrast of the image: "lin" or "hist"
ext	An SpatExtent object to zoom in to a region of interest (see draw)
interpolate	logical. If TRUE, interpolate the image when drawing
colNA	color for the background (NA values)
alpha	transparency. Integer between 0 (transparent) and 255 (opaque)
bgalpha	Background transparency. Integer between 0 (transparent) and 255 (opaque)
addfun	Function to add additional items such as points or polygons to the plot (map). See plot
zlim	numeric vector of length 2. Range of values to plot (optional)
zlimcol	If NULL the values outside the range of zlim get the color of the extremes of the range. If zlimcol has any other value, the values outside the zlim range get the color of NA values (see colNA)
axes	logical. If TRUE axes are drawn (and arguments such as main="title" will be honored)
xlab	character. Label of x-axis
ylab	character. Label of y-axis
asp	numeric. Aspect (ratio of x and y. If NULL, and appropriate value is computed to match data for the longitude/latitude coordinate reference system, and 1 for planar coordinate reference systems
add	logical. If TRUE add values to current plot
...	graphical parameters as in plot or rasterImage

See Also

[plot](#)

Examples

```
b <- rast(system.file("ex/logo.tif", package="terra"))
plotRGB(b)
plotRGB(b, mar=c(2,2,2,2))
plotRGB(b, 3, 2, 1)
plotRGB(b, 3, 2, 1, stretch='hist')
```

 predict

Spatial model predictions

Description

Make a `SpatRaster` object with predictions from a fitted model object (for example, obtained with `glm` or `randomForest`). The first argument is a `SpatRaster` object with the predictor variables. The `names` in the `Raster` object should exactly match those expected by the model. Any regression like model for which a `predict` method has been implemented (or can be implemented) can be used.

This approach of using model predictions is commonly used in remote sensing (for the classification of satellite images) and in ecology, for species distribution modeling.

Usage

```
## S4 method for signature 'SpatRaster'
predict(object, model, fun=predict, ..., factors=NULL, const=NULL,
na.rm=FALSE, index=NULL, cores=1, filename="", overwrite=FALSE, wopt=list())
```

Arguments

<code>object</code>	<code>SpatRaster</code>
<code>model</code>	fitted model of any class that has a "predict" method (or for which you can supply a similar method as <code>fun</code> argument. E.g. <code>glm</code> , <code>gam</code> , or <code>randomForest</code>)
<code>fun</code>	function. The <code>predict</code> function that takes <code>model</code> as first argument. The default value is <code>predict</code> , but can be replaced with e.g. <code>predict.se</code> (depending on the type of model), or your own custom function
<code>...</code>	additional arguments for <code>fun</code>
<code>const</code>	<code>data.frame</code> . Can be used to add a constant value as a predictor variable so that you do not need to make a <code>SpatRaster</code> layer for it
<code>factors</code>	list with levels for factor variables. The list elements should be named with names that correspond to names in <code>object</code> such that they can be matched. This argument may be omitted for standard models such as "glm" as the <code>predict</code> function will extract the levels from the <code>model</code> object, but it is necessary in some other cases (e.g. <code>cforest</code> models from the <code>party</code> package)
<code>na.rm</code>	logical. If <code>TRUE</code> , cells with NA values in the predictors are removed from the computation. This option prevents errors with models that cannot handle NA values. In most other cases this will not affect the output. An exception is when predicting with a model that returns predicted values even if some (or all!) variables are NA
<code>index</code>	integer. To select subset of output variables
<code>cores</code>	positive integer. If <code>cores > 1</code> , a 'parallel' package cluster with that many cores is created and used
<code>filename</code>	character. Output filename
<code>overwrite</code>	logical. If <code>TRUE</code> , <code>filename</code> is overwritten
<code>wopt</code>	list with named options for writing files as in <code>writeRaster</code>

Value

SpatRaster

Examples

```

logo <- rast(system.file("ex/logo.tif", package="terra"))
names(logo) <- c("red", "green", "blue")
p <- matrix(c(48, 48, 48, 53, 50, 46, 54, 70, 84, 85, 74, 84, 95, 85,

sr <- values(spatSample(logo, 100, as.raster=TRUE))
pca <- prcomp(sr)

x <- predict(logo, pca)
plot(x)

```

project

Change the coordinate reference system

Description

Change the coordinate reference system ("project") of a `SpatVector` or `SpatRaster`.

Usage

```

## S4 method for signature 'SpatVector'
project(x, y)

## S4 method for signature 'SpatRaster'
project(x, y, method="bilinear", mask=FALSE, filename="", ...)

```

Arguments

x	<code>SpatVector</code>
y	if (x is a <code>SpatRaster</code> , the preferred approach is for y to be a <code>SpatRaster</code> as well, serving as a template for the output <code>SpatRaster</code> . Alternatively, you can provide a character variable containing a textual coordinate reference system (crs). You can use the following formats to provide textual coordinate reference system (crs) definitions: WKT, PROJ.4 (e.g., <code>+proj=longlat +datum=WGS84</code>), or an EPSG code (e.g., <code>"epsg:4326"</code>) to define the output coordinate reference system (crs). But note that when using PROJ.4 you now must use the WGS84 datum. Other datums are silently ignored. If x is a <code>SpatVector</code> , you can provide a crs definition as discussed above, or any other object from which such a crs can be extracted with crs
method	character. Method used for estimating the new cell values. One of: near: nearest neighbor. This method is fast, and it can be the preferred method if the cell values represent classes. It is not a good choice for continuous values. bilinear: bilinear interpolation. Default. cubic: cubic interpolation. cubicspline: cubic spline interpolation.
mask	logical. If TRUE, mask out areas outside the input extent (see example with Robinson projection)
filename	character. Output filename
...	additional arguments for writing files as in writeRaster

Value

SpatVector or SpatRaster

Note

User beware. Sadly, the PROJ.4 notation has been partly deprecated in the GDAL/PROJ library that is used by this function. You can still use this notation, but *only* with the the WGS84 datum. Other datums are silently ignored.

When printing a Spat* object the PROJ.4 notation is shown because it is the most concise and clear format available. However, internally a WKT representation is used (see [crs](#)).

Transforming (projecting) raster data is fundamentally different from transforming vector data. Vector data can be transformed and back-transformed without loss in precision and without changes in the values. This is not the case with raster data. In each transformation the values for the new cells are estimated in some fashion. Therefore, if you need to match raster and vector data for analysis, you should generally transform the vector data.

When using this method with a SpatRaster, the preferable approach is to provide a template SpatRaster as argument *y*. The template is then another raster dataset that you want your data to align with. If you do not have a template to begin with, you can do `project(x, crs)` and then manipulate the output to get the template you want. For example, where possible use whole numbers for the extent and resolution so that you do not have to worry about small differences in the future. You can use commands like `dim(z) = c(180, 360)` or `res(z) <- 100000`.

The output resolution should be similar to the input resolution, but there is not "correct" resolution in raster transformation; but it is not obvious what this resolution is if you are using lon/lat data that spans a large North-South extent.

See Also

[crs](#), [resample](#)

Examples

```
## SpatRaster
a <- rast(ncol=40, nrow=40, xmin=-110, xmax=-90, ymin=40, ymax=60,
         crs="+proj=longlat +datum=WGS84")
values(a) <- 1:ncell(a)
newcrs="+proj=lcc +lat_1=48 +lat_2=33 +lon_0=-100 +datum=WGS84"
b <- rast(ncol=94, nrow=124, xmin=-944881, xmax=935118, ymin=4664377, ymax=7144377, crs=newcrs)
w <- project(a, b)

## SpatVector
f <- system.file("ex/lux.shp", package="terra")
v <- vect(f)
crs <- "+proj=moll +lon_0=0 +x_0=0 +y_0=0 +ellps=WGS84 +datum=WGS84"
p <- project(v, crs)
p
```

quantile	<i>SpatRaster local quantiles</i>
----------	-----------------------------------

Description

Compute quantiles for each cell across the layers of a `SpatRaster`

Usage

```
## S4 method for signature 'SpatRaster'  
quantile(x, probs=seq(0, 1, 0.25), na.rm=FALSE, filename="", ...)
```

Arguments

<code>x</code>	<code>SpatRaster</code>
<code>probs</code>	numeric vector of probabilities with values in [0,1]
<code>na.rm</code>	logical. If TRUE, NA's are removed from x before the quantiles are computed
<code>filename</code>	character. Output filename
<code>...</code>	additional arguments for writing files as in writeRaster

Value

`SpatRaster` with layers representing quantiles

See Also

[app](#)

Examples

```
r <- rast(system.file("ex/logo.tif", package="terra"))  
r <- c(r/2, r, r*2)  
q <- quantile(r)  
q  
  
# same but slower  
# qa <- app(r, quantile)
```

 range

Get or compute the minimum and maximum cell values

Description

The minimum and maximum value of a `SpatRaster` are returned or computed (from a file on disk if necessary) and stored in the object.

Usage

```
## S4 method for signature 'SpatRaster'
minmax(x)
## S4 method for signature 'SpatRaster'
setMinMax(x, force=FALSE)
```

Arguments

`x` `SpatRaster`
`force` logical. If TRUE min and max values are recomputed even if already available

Value

`setMinMax`: nothing. Used for the side-effect of computing the minimum and maximum values of a `SpatRaster`
`minmax`: numeric matrix of minimum and maximum cell values by layer

Examples

```
r <- rast(system.file("ex/elev.tif", package="terra"))
minmax(r)
```

 rapp

Apply a function to a range of the layers of a SpatRaster

Description

Apply a function to a range of the layers of a `SpatRaster`. The range is specified for each cell separately by a two-layer `SpatRaster` index.

The function used should return a single value.

See [app](#) or [Summary-methods](#) if you want to apply a function to all layers (or a subset of all layers) in a `SpatRaster`.

Usage

```
## S4 method for signature 'SpatRaster'  
rapp(x, index, fun, ..., filename="", overwrite=FALSE, wopt=list())
```

Arguments

x	SpatRaster
index	factor or numeric (integer). Vector of length <code>nlyr(x)</code> (shorter vectors are recycled) grouping the input layers
fun	function to be applied
...	additional arguments passed to fun
filename	character. Output filename
overwrite	logical. If TRUE, filename is overwritten
wopt	list with named options for writing files as in writeRaster

Value

SpatRaster

See Also

[app](#), [Summary-methods](#), [lapp](#), [tapp](#)

Examples

```
r <- rast(ncol=9, nrow=9)  
values(r) <- 1:ncell(r)  
s <- c(r, r, r, r, r, r)  
s <- s * 1:6  
  
start <- end <- rast(r)  
start[] <- 1:3  
end[] <- 4:6  
index <- c(start, end)  
  
rapp(s, index, fun="mean")
```

Description

Methods to create a SpatRaster. These objects can be created from scratch or from a file.

A SpatRaster represents a spatially referenced surface divided into three dimensional cells (rows, columns, and layers).

When a SpatRaster is created from a file, it does not load the cell (pixel) values into memory (RAM). It only reads the basic parameters that describe the SpatRaster such as the number of rows and columns and the coordinate reference system. The actual values will be read, perhaps in chunks – to avoid memory overflows – as needed.

Usage

```
## S4 method for signature 'character'
rast(x, subds=0)

## S4 method for signature 'missing'
rast(x, nrows=180, ncols=360, nlyrs=1, xmin=-180, xmax=180,
      ymin=-90, ymax=90, crs, extent, resolution, vals)

## S4 method for signature 'SpatRaster'
rast(x, nlyrs=nlyr(x))

## S4 method for signature 'matrix'
rast(x, type="", crs="", digits=6)

## S4 method for signature 'list'
rast(x)

## S4 method for signature 'SpatRasterDataset'
rast(x)

## S4 method for signature 'SpatVector'
rast(x, ...)

## S4 method for signature 'SpatExtent'
rast(x, ...)
```

Arguments

x	filename (character), missing, SpatRaster, SpatRasterDataset, SpatExtent, SpatVector, matrix, array, list of SpatRaster objects. For other types it will be attempted to create a SpatRaster via ('as(x, "SpatRaster")')
subds	positive integer or character to select a subdataset. If zero or "", all subdatasets are returned (if possible)
nrows	positive integer. Number of rows
ncols	positive integer. Number of columns
nlyrs	positive integer. Number of layers

xmin	minimum x coordinate (left border)
xmax	maximum x coordinate (right border)
ymin	minimum y coordinate (bottom border)
ymax	maximum y coordinate (top border)
crs	character. PROJ.4 type description of a Coordinate Reference System (map projection). If this argument is missing, and the x coordinates are within -360 .. 360 and the y coordinates are within -90 .. 90, "+proj=longlat +datum=WGS84" is used
extent	object of class SpatExtent. If present, the arguments xmin, xmax, ymin and ymax are ignored
resolution	numeric vector of length 1 or 2 to set the resolution (see res). If this argument is used, arguments ncol and nrow are ignored
vals	numeric. An optional vector with cell values (if fewer values are provided, these are recycled to reach the number of cells)
type	character. If the value is not "xyz", the raster has the same number of rows and columns as the matrix. If the value is "xyz", the matrix must have at least two columns, the first with x (or longitude) and the second with y (or latitude) coordinates that represent the centers of raster cells. The additional columns are the values associated with the raster cells.
digits	integer to set the precision for detecting whether points are on a regular grid (a low number of digits is a low precision). Only used when type="xyz"
...	additional arguments, in some cases passed on to the rast,missing-method

Details

The files are opened and read via GDAL. GDAL guesses the file format from the name, and/or else tries reading it with different "drivers" until it succeeds. In very few cases this may cause a file to be opened with wrong driver, and some information may be lost (for example because of opening a netCDF file with the HDF5 driver. You can avoid that by prepending the driver name to the filename like this: `rast('NETCDF:"filename.ncdf"')`

Value

SpatRaster

Examples

```
# Create a SpatRaster from scratch
x <- rast(nrow=108, ncol=21, xmin=0, xmax=10)

# Create a SpatRaster from a file
f <- system.file("ex/elev.tif", package="terra")
r <- rast(f)

s <- rast(system.file("ex/logo.tif", package="terra"))

# Create a skeleton with no associated cell values
rast(s)
```

rasterize

*Rasterize vector data***Description**

Transfer vector data to a raster

Usage

```
## S4 method for signature 'SpatVector,SpatRaster'
rasterize(x, y, field, fun, background=NA, update=FALSE, touches=is.lines(x),
cover=FALSE, filename="", ...)
```

Arguments

x	SpatVector
y	SpatRaster
field	character, numeric, or missing. If field is a character, it should a variable name in x or vector of values if fun can handle these. If field is numeric it should be a single number (index the variable), or a vector with the same length as x. If it is missing, 1:nrow(x) is used
fun	function, summarizing function that returns a single number; for when there are multiple points in one cell. For example mean, length (to get a count), min or max. Only used if x consists of points
background	numeric. Value to put in the cells that are not covered by any of the features of x. Default is NA
touches	logical. If TRUE, all cells touched by lines or polygons are affected, not just those on the line render path, or whose center point is within the polygon
update	logical. If TRUE, the values of the SpatRaster are updated for the cells that overlap with the geometries of x. Default is FALSE
cover	logical. If TRUE and the geometry of x is polygons, the fraction of a cell that is covered by the polygons is returned. This is estimated by determining presence/absence of the polygon in the each subcell
filename	character. Output filename
...	additional arguments for writing files as in writeRaster

Value

SpatRaster

See Also

[mask](#)

Examples

```
f <- system.file("ex/lux.shp", package="terra")
v <- vect(f)
r <- rast(v, ncol=75, nrow=100)
#x <- rasterize(v, r, "NAME_2")

#plot(x)
#lines(v)
```

read and write	<i>Read from, or write to, file</i>
----------------	-------------------------------------

Description

Methods to read from or write chunks of values to or from a file. These are low level methods for programmers. Use `writeRaster` if you want to save an entire `SpatRaster` to file in one step. It is much easier to use.

To write chunks, begin by opening a file with `writeStart`, then write values to it in chunks. When writing is done close the file with `writeStop`.

Usage

```
## S4 method for signature 'SpatRaster'
readStart(x)

## S4 method for signature 'SpatRaster'
readStop(x)

## S4 method for signature 'SpatRaster'
readValues(x, row=1, nrow=nrow(x), col=1, ncol=ncol(x), mat=FALSE, dataframe=FALSE)

## S4 method for signature 'SpatRaster,character'
writeStart(x, filename="", overwrite=FALSE, ...)

## S4 method for signature 'SpatRaster'
writeStop(x)

## S4 method for signature 'SpatRaster,vector'
writeValues(x, v, start, nrow)
```

Arguments

<code>x</code>	<code>SpatRaster</code>
<code>filename</code>	character. Output filename
<code>v</code>	vector with cell values to be written
<code>start</code>	integer. Row number (counting starts at 1) from where to start writing <code>v</code>

row	positive integer. Row number to start from, should be between 1 and nrow(x)
nrows	positive integer. How many rows?
col	positive integer. Column number to start from, should be between 1 and ncol(x)
ncols	positive integer. How many columns? Default is the number of columns left after the start column
mat	logical. If TRUE, values are returned as a matrix instead of as a vector, except when dataframe is TRUE
dataframe	logical. If TRUE, values are returned as a data.frame instead of as a vector (also if matrix is TRUE)
overwrite	logical. If TRUE, filename is overwritten
...	additional arguments for writing files as in writeRaster

Value

readValues returns a vector, matrix, or data.frame

writeStart returns a list that can be used for processing the file in chunks.

The other methods invisibly return a logical value indicating whether they were succesful or not. Their purpose is the side-effect of opening or closing files.

rectify

rectify a SpatRaster

Description

Rectify a rotated SpatRaster into a non-rotated object

Usage

```
## S4 method for signature 'SpatRaster'
rectify(x, method="bilinear", aoi=NULL, snap=TRUE,
        filename="", ...)
```

Arguments

x	SpatRaster to be rectified
method	character. Method used to for resampling. See resample
aoi	SpatExtent or SpatRaster to crop x to a smaller area of interest; Using a SpatRaster allowing to set the exact output extent and output resolution
snap	logical. If TRUE, the origin and resolution of the output are the same as would the case when aoi = NULL. Only relevant if aoi is a SpatExtent
filename	character. Output filename
...	additional arguments for writing files as in writeRaster

Value

SpatRaster

relate	<i>relate</i>
--------	---------------

Description

Get a matrix indicating the presence or absence of spatial relationships between geometries.

Usage

```
## S4 method for signature 'SpatVector,SpatVector'
relate(x, y, relation)

## S4 method for signature 'SpatVector,missing'
relate(x, y, relation, pairs=FALSE, symmetrical=FALSE)
```

Arguments

x	SpatVector or any object for which vect returns a SpatVector or else for which ext returns a SpatExtent
y	missing or as for x
relation	character. One of "intersects", "touches", "crosses", "overlaps", "within", "contains", "covers", "coveredby", "disjoint". Or a "DE-9IM" string such as "FF*FF*****". See wikipedia or geotools doc
pairs	logical. If TRUE a "from", "to" matrix is returned for the cases where the requested relation is TRUE
symmetrical	logical. If TRUE and pairs=TRUE, the relation between a pair is only included once. For example, the relation between geometry 1 and 3 is included, but the relation between 3 and 1 is not. Note that whole some relationships are symmetrical (e.g. "touches", other are not (e.g. "within"))

Value

matrix

rep

Combine

Description

Replicate layers in a SpatRaster

Usage

```
## S4 method for signature 'SpatRaster'
rep(x, ...)
```

Arguments

x	SpatRaster
...	arguments as in rep

Value

SpatRaster

Examples

```

s <- rast(system.file("ex/logo.tif", package="terra"))
x <- rep(s, 2)
nlyr(x)
names(x)
x

```

replace	<i>Replace values of a SpatRaster</i>
---------	---------------------------------------

Description

Replace values of a SpatRaster. These are convenience functions for smaller objects only.

Value

SpatRaster

See Also

[values](#)

Examples

```
r <- rast(ncol=5, nrow=5, xmin=0, xmax=5, ymin=0, ymax=5)
r[] <- 1:25
r[1,] <- 5
r[,2] <- 10
r[r>10] <- NA
```

resample	<i>Transfer values of a SpatRaster to another one with a different geometry</i>
----------	---

Description

resample transfers values between SpatRaster objects that do not align (have a different origin and/or resolution). See [project](#) to change the coordinate reference system (crs).

If the origin and crs are the same, you should consider using these other functions instead: [aggregate](#), [disaggregate](#), [expand](#) or [crop](#).

Usage

```
## S4 method for signature 'SpatRaster,SpatRaster'
resample(x, y, method="bilinear", filename="", ...)
```

Arguments

x	SpatRaster to be resampled
y	SpatRaster that x should be resampled to
method	character. Method used for estimating the new cell values. One of: near: nearest neighbour. This method is fast, and the preferred method if the cell values represent classes. It is not a good choice for continuous values. bilinear: bilinear interpolation. Default. cubic: cubic interpolation. cubicspline: cubic spline interpolation. lanczos: Lanczos windowed sinc resampling.
filename	character. Output filename
...	additional arguments for writing files as in writeRaster

Value

SpatRaster

See Also[aggregate](#), [disaggregate](#), [crop](#), [project](#),**Examples**

```
r <- rast(nrow=3, ncol=3, xmin=0, xmax=10, ymin=0, ymax=10)
values(r) <- 1:ncell(r)
s <- rast(nrow=25, ncol=30, xmin=1, xmax=11, ymin=-1, ymax=11)
x <- resample(r, s, method="bilinear")

opar <- par(no.readonly =TRUE)
par(mfrow=c(1,2))
plot(r)
plot(x)
par(opar)
```

rescale

*rescale***Description**Rescale a SpatVector or SpatRaster. This may be useful to make small [inset](#) maps.

Usage

```
## S4 method for signature 'SpatRaster'
rescale(x, f=0.5, x0, y0)

## S4 method for signature 'SpatVector'
rescale(x, f=0.5, x0, y0)
```

Arguments

x	SpatVector or SpatRaster
f	numeric. The scaling factor (a fraction)
x0	numeric. x-coordinate of the center of rescaling. If missing, the center of the extent of x is used
y0	numeric. y-coordinate of the center of rescaling. If missing, the center of the extent of x is used

Value

Same as x

See Also

[t](#), [shift](#), [flip](#), [rotate](#), [inset](#)

Examples

```
f <- system.file("ex/lux.shp", package="terra")
v <- vect(f)
w <- rescale(v, 0.2)
plot(v)
lines(w, col="red")
```

rotate

Rotate a SpatRaster along longitude

Description

Rotate a SpatRaster that has longitude coordinates from 0 to 360, to standard coordinates between -180 and 180 degrees (or vice-versa). Longitude between 0 and 360 is frequently used in global climate models.

Usage

```
## S4 method for signature 'SpatRaster'
rotate(x, left=TRUE, filename="", ...)
```

Arguments

<code>x</code>	SpatRaster or SpatVector
<code>left</code>	logical. If TRUE, rotate to the left, else to the right
<code>filename</code>	character. Output filename
<code>...</code>	additional arguments for writing files as in writeRaster

Value

SpatRaster

See Also

[shift](#) and [spin](#)

Examples

```
x <- rast(nrow=9, ncol=18, nl=3, xmin=0, xmax=360)
v <- rep(as.vector(t(matrix(1:ncell(x), nrow=9, ncol=18))), 3)
values(x) <- v
z <- rotate(x)
```

sbar

scalebar

Description

Add a scalebar to a plot

Usage

```
sbar(d, xy=NULL, type="line", divs=2, below="",
     lonlat=NULL, label, adj=c(0.5, -1), lwd=2, xpd=TRUE, ...)
```

Arguments

<code>d</code>	numeric. Distance covered by the scalebar. In the units of the coordinates of the plot, and in km for angular (longitude/latitude) data; see <code>lonlat</code>
<code>xy</code>	x and y coordinate to place the plot. Can be NULL. Use <code>xy=click()</code> to make this interactive
<code>type</code>	"line" or "bar"
<code>divs</code>	number of divisions for a bar: 2 or 4
<code>below</code>	character. Text to go below scalebar (e.g., "kilometers")
<code>lonlat</code>	logical or NULL. If logical, TRUE indicates if the plot is using longitude/latitude coordinates. If NULL this is guessed from the plot's coordinates
<code>adj</code>	adjustment for text placement

label	vector of three numbers to label the scale bar (beginning, midpoint, end)
lwd	line width for the "line" type scalebar
xpd	logical. If TRUE, the scalebar can be (partly) outside the plot area
...	graphical arguments to be passed to other methods

Value

none

See Also

[plot](#), [inset](#)

Examples

```
f <- system.file("ex/test.tif", package="terra")
r <- rast(f)
plot(r)
sbar(1000)
sbar(1000, xy=c(178500, 333500), type="bar", divs=4, cex=.8)

f <- system.file("ex/elev.tif", package="terra")
r <- rast(f)
plot(r, type="interval")
sbar(20, c(6.2, 50.1), type="bar", cex=.8, divs=4)
sbar(15, c(6.3, 50), type="bar", below="km", label=c(0,7.5,15), cex=.8)
sbar(15, c(6.65, 49.9), cex=.8, label=c(0,"km",15))

sbar(15, c(6.65, 49.8), cex=.8, label="15 kilometer", lwd=5)

sbar(15, c(6.65, 49.7), divs=4, cex=.8, below="km")
```

scale

Scale values

Description

Center and/or scale raster data. For details see [link{scale}](#)

Usage

```
## S4 method for signature 'SpatRaster'
scale(x, center=TRUE, scale=TRUE)
```

Arguments

x	SpatRaster
center	logical or numeric. If TRUE, centering is done by subtracting the layer means (omitting NAs), and if FALSE, no centering is done. If center is a numeric vector (recycled to <code>nlyr(x)</code>), then each layer of x has the corresponding value from center subtracted from it.
scale	logical or numeric. If TRUE, scaling is done by dividing the (centered) layers of x by their standard deviations if center is TRUE, and the root mean square otherwise. If scale is FALSE, no scaling is done. If scale is a numeric vector (recycled to <code>nlyr(x)</code>), each layer of x is divided by the corresponding value. Scaling is done after centering.

Value

SpatRaster

See Also

[scale](#)

Examples

```
r <- rast(system.file("ex/logo.tif", package="terra"))
s <- scale(r)

## the equivalent, computed in steps
m <- global(r, "mean")
rr <- r - m[,1]
rms <- global(rr, "rms")
ss <- rr / rms[,1]
```

scatterplot

Scatterplot of two SpatRaster layers

Description

Scatterplot of the values of two SpatRaster layers

Usage

```
## S4 method for signature 'SpatRaster,SpatRaster'
plot(x, y, maxcell=100000, warn=TRUE, nc, nr,
     maxnl=16, gridded=FALSE, ncol=25, nrow=25, ...)
```

Arguments

x	SpatRaster
y	SpatRaster
maxcell	positive integer. Maximum number of cells to use for the plot
nc	positive integer. Optional. The number of columns to divide the plotting device in (when plotting multiple layers)
nr	positive integer. Optional. The number of rows to divide the plotting device in (when plotting multiple layers)
maxnl	positive integer. Maximum number of layers to plot (for multi-layer objects)
gridded	logical. If TRUE the scatterplot is gridded (counts by cells)
warn	boolean. Show a warning if a sample of the pixels is used (for scatterplot only)
ncol	positive integer. Number of columns for gridding
nrow	positive integer. Number of rows for gridding
...	additional graphical arguments

Examples

```
s <- rast(system.file("ex/logo.tif", package="terra"))
plot(s[[1]], s[[2]])
plot(s, sqrt(s[[3:1]]))
```

sds

Create a SpatRasterDataset

Description

Methods to create a SpatRasterDataset. This is an object to hold "sub-datasets", each a SpatRaster that in most cases will have multiple layers.

See [describe](#) for getting information about the sub-datasets present in a file.

Usage

```
## S4 method for signature 'missing'
sds(x, ...)

## S4 method for signature 'character'
sds(x, ids=0, ...)

## S4 method for signature 'SpatRaster'
sds(x, ...)

## S4 method for signature 'list'
sds(x, ...)
```

Arguments

- x character (filename), or SpatRaster, or list of SpatRaster objects, or missing. If multiple filenames are provided, it is attempted to make SpatRasters from these, and combine them into a SpatRasterDataset
- ids optional. vector of integer subdataset ids. Ignored if the first value is not a positive integer
- ... additional arguments. Can be other SpatRaster objects if x is a SpatRaster

Value

SpatRasterDataset

See Also

[describe](#)

Examples

```
s <- rast(system.file("ex/logo.tif", package="terra"))
x <- sds(s, s/2)
names(x) <- c("first", "second")
x
length(x)

# extract the second SpatRaster
x[2]
```

select

Spatial selection

Description

Geometrically subset SpatRaster or SpatVector (to be done) by drawing on a plot (map).

Usage

```
## S4 method for signature 'SpatRaster'
select(x, ...)

## S4 method for signature 'SpatVector'
select(x, use="rec", draw=TRUE, col="cyan", ...)
```

Arguments

x	SpatRaster or SpatVector
use	character indicating what to draw. One of "rec" (rectangle) or "pol" (polygon)
draw	logical. If TRUE the selection is drawn on the map
col	color to be used for drawing if draw=TRUE
...	additional graphics arguments for drawing

Value

SpatRaster or SpatVector

See Also

[crop](#) and [intersect](#) to make an intersection and [click](#) and [text](#) to see cell values or geometry attributes

Examples

```
## Not run:
# select a subset of a SpatRaster
r <- rast(nrow=10, ncol=10)
values(r) <- 1:ncell(r)
plot(r)
s <- select(r) # now click on the map twice

# plot the selection on a new canvas:
x11()
plot(s)

# vector
f <- system.file("ex/lux.shp", package="terra")
v <- vect(f)
plot(v)
x <- select(v) # now click on the map twice
x

## End(Not run)
```

selectRange

Select the values of a range of layers, as specified by cell values in another SpatRaster

Description

Use a single layer SpatRaster object to select cell values from different layers in a multi-layer SpatRaster. The values of the SpatRaster to select layers (y) should be between 1 and nlyr(x) (values outside this range are ignored); they are also truncated to integers.

See [rapp](#) for applying af function to a range of variable size.

See [extract](#) for extraction of values by cell, point, or otherwise.

Usage

```
## S4 method for signature 'SpatRaster'
selectRange(x, y, z=1, repint=0, filename="", ...)
```

Arguments

x	SpatRaster
y	SpatRaster. Cell values must be positive integers. They indicate the first layer to select for each cell
z	positive integer. The number of layers to select
repint	integer > 1 and < nlyr(x) allowing for repeated selection at a fixed interval. For example, if x has 36 layers, and the value of a cell in y=2 and repint = 12, the values for layers 2, 14 and 26 are returned
filename	character. Output filename
...	additional arguments for writing files as in writeRaster

Value

SpatRaster

See Also

[rapp](#), [tapp](#), [extract](#)

Examples

```
r <- rast(ncol=10, nrow=10)
values(r) <- 1
s <- c(r, r+2, r+5)
s <- c(s, s)
set.seed(1)
values(r) <- sample(3, ncell(r), replace=TRUE)
x <- selectRange(s, r)

x <- selectRange(s, r, 3)
```

separate

separate

Description

Create a SpatRaster with a layer for each class (value, or subset of the values) in the input SpatRaster. For example, if the input has vegetation types, this function will create a layer (presence/absence; dummy variable) for each of these classes. Classes and cell values are always truncated to integers.

This is called "one-hot encoding" or "dummy encoding" (for a dummy encoding scheme you can remove (any) one of the output layers as it is redundant).

Usage

```
## S4 method for signature 'SpatRaster'
separate(x, classes=NULL, keep=FALSE, other=0, filename="", ...)
```

Arguments

x	SpatRaster
classes	numeric. The values (classes) for which layers should be made. If NULL all classes are used
keep	logical. If TRUE, cells that are of the class represented by a layer get that value, rather than a value of 1
other	numeric. Value to assign to cells that are not of the class represented by a layer
filename	character. Output filename
...	additional arguments for writing files as in writeRaster

Value

SpatRaster

Examples

```
r <- rast(nrow=5, ncol=5)
values(r) <- rep(c(1:4, NA), each=5)
b <- separate(r)
bb <- separate(r, keep=TRUE, other=NA)
```

shift

Shift

Description

Shift a SpatRaster, SpatVector or SpatExtent to another location.

Usage

```
## S4 method for signature 'SpatRaster'
shift(x, dx=0, dy=0, filename="", ...)
```

```
## S4 method for signature 'SpatVector'
shift(x, dx=0, dy=0)
```

```
## S4 method for signature 'SpatExtent'
shift(x, dx=0, dy=0)
```

Arguments

x	SpatRaster, SpatVector or SpatExtent
dx	numeric. The shift in horizontal direction
dy	numeric. The shift in vertical direction
filename	character. Output filename
...	additional arguments for writing files as in writeRaster

Value

Same as x

See Also

[flip](#), [rotate](#)

Examples

```
r <- rast(xmin=0, xmax=1, ymin=0, ymax=1)
r <- shift(r, dx=1, dy=-1)

e <- ext(r)
shift(e, 5, 5)
```

sources

Data sources of a SpatRaster

Description

Get the data sources of a SpatRaster and the number of layers by source. Sources are either files (or similar resources) or "", meaning that they are in memory. You can use `hasValues` to check if in-memory layers actually have values.

Usage

```
## S4 method for signature 'SpatRaster'
sources(x)

## S4 method for signature 'SpatRaster'
hasValues(x)
```

Arguments

x	SpatRaster
---	------------

Value

`sources` returns a data.frame with the source names (if any) and the number of layers by source

Examples

```
f <- system.file("ex/test.tif", package="terra")
r <- rast(f)
s <- rast(r)
values(s) <- 1:ncell(s)
rs <- c(r,r,s,r)
sources(rs)
hasValues(r)
x <- rast()
hasValues(x)
```

SpatExtent-class

Class "SpatExtent"

Description

Objects of class SpatExtent are used to define the spatial extent (extremes) of objects of the SpatRaster class.

Objects from the Class

You can use the `ext` function to create SpatExtent objects, or to extract them from SpatRaster objects.

Slots

`ptr`: pointer to the C++ class

Methods

`show` display values of a SpatExtent object

Examples

```
e <- ext(-180, 180, -90, 90)
e
```

SpatRaster-class	<i>SpatRaster class</i>
------------------	-------------------------

Description

A SpatRaster represents a rectangular part of the world that is sub-divided into rectangular cells of equal area (in terms of the units of the coordinate reference system). For each cell can have multiple values ("layers").

An object of the SpatRaster class can point to one or more files on disk that hold the cell values, and/or it can hold these values in memory. These objects can be created with the `rast` method.

The underlying C++ class "Rcpp_SpatRaster" is not intended for end-users. It is for internal use within this package only.

Examples

```
rast()
```

spatSample	<i>Take a regular sample</i>
------------	------------------------------

Description

Take a spatial sample from a SpatRaster, SpatVector or SpatExtent. Sampling a SpatVector or SpatExtent always returns a SpatVector of points.

With a SpatRaster, you can get cell values, cell numbers (`cells=TRUE`), coordinates (`xy=TRUE`) or (when `type="regular"` and `as.raster=TRUE`) get a new SpatRaster with the same extent, but fewer cells.

In order to assure regularity when requesting a regular sample, the number of cells or points returned may not be exactly the same as the size requested.

Usage

```
## S4 method for signature 'SpatRaster'
spatSample(x, size, method="random", replace=FALSE,
           na.rm=FALSE, as.raster=FALSE, cells=FALSE, xy=FALSE, ext=NULL, warn=TRUE)
```

```
## S4 method for signature 'SpatVector'
spatSample(x, size, method="random", strata=NULL, chess="")
```

```
## S4 method for signature 'SpatExtent'
spatSample(x, size, method="random", lonlat)
```

Arguments

<code>x</code>	SpatRaster
<code>size</code>	numeric. The sample size. If <code>x</code> is a SpatVector, you can also provide a vector of the same length as <code>x</code> in which case sampling is done separately for each geometry
<code>method</code>	character. Should be "regular" or "random". It can also be "stratified" if <code>x</code> is a SpatVector
<code>replace</code>	logical. If TRUE, sampling is with replacement (if <code>method="random"</code>)
<code>na.rm</code>	logical. If TRUE, codeNAs are removed. Only used with random sampling of cell values. That is with <code>method="random"</code> , <code>as.raster=FALSE</code> , <code>cells=FALSE</code>
<code>as.raster</code>	logical. If TRUE, a SpatRaster is returned
<code>cells</code>	logical. If TRUE and <code>xy=FALSE</code> , cellnumbers are returned instead of values
<code>xy</code>	logical. If TRUE, coordinates are returned instead of values
<code>ext</code>	SpatExtent or NULL to restrict sampling to a subset of the area of <code>x</code>
<code>warn</code>	logical. Give a warning if the sample size returned is smaller than requested
<code>strata</code>	if not NULL, stratified random sampling is done, taking <code>size</code> samples from each stratum. If <code>x</code> has polygon geometry, <code>strata</code> must be a field name (or index) in <code>x</code> . If <code>x</code> has point geometry, <code>strata</code> can be a SpatVector of polygons or a SpatRaster
<code>chess</code>	character. One of "", "white", or "black". For stratified sampling if <code>strata</code> is a SpatRaster. If not "", samples are only taken from alternate cells, organized like the "white" or "black" fields on a chessboard
<code>lonlat</code>	logical. If TRUE, sampling of a SpatExtent is weighted by <code>cos(latitude)</code> . For SpatRaster and SpatVector this done based on the crs , but it is ignored if <code>as.raster=TRUE</code>

Details

In stead of `spatSample(x, size, method="random")` you can also use the equivalent base method `sample(x, size)`. The base method also works for sampling the geometries of SpatVector (you can take a sample from the number of geometries and use that as an index).

Value

numeric or SpatRaster

Examples

```
f <- system.file("ex/elev.tif", package="terra")
r <- rast(f)
s <- spatSample(r, 10, as.raster=TRUE)
spatSample(r, 10)
spatSample(r, 10, "random")

## if you require cell numbers and/or coordinates
size <- 6
# random cells
cells <- spatSample(r, 6, "random", cells=TRUE)
```

```
v <- r[cells]
xy <- xyFromCell(r, cells)
cbind(xy, v)

# regular
cells <- spatSample(r, 6, "regular", cells=TRUE)
v <- r[cells]
xy <- xyFromCell(r, cells)
cbind(xy, v)

## SpatExtent
e <- ext(r)
spatSample(e, 10, "random", lonlat=TRUE)

## SpatVector
f <- system.file("ex/lux.shp", package="terra")
v <- vect(f)
#sample geometries
i <- sample(nrow(v), 5)
vv <- v[i,]
```

SpatVector-class *Class "SpatVector"*

Description

Objects of class SpatVector.

Objects from the Class

You can use the [vect](#) method to create SpatVector objects.

Slots

ptr: pointer to the C++ class

Methods

show display values of a SpatVector

spin *spin a SpatVector*

Description

Spin (rotate) the geometry of a SpatVector.

Usage

```
## S4 method for signature 'SpatVector'  
spin(x, angle, x0, y0)
```

Arguments

x	SpatVector
angle	numeric. Angle of rotation in degrees
x0	numeric. x-coordinate of the center of rotation. If missing, the center of the extent of x is used
y0	numeric. y-coordinate of the center of rotation. If missing, the center of the extent of x is used

Value

SpatVector

See Also

[rescale](#), [t](#), [shift](#)

Examples

```
f <- system.file("ex/lux.shp", package="terra")  
v <- vect(f)  
w <- spin(v, 180)  
plot(v)  
lines(w, col="red")  
  
# lower-right corner as center  
e <- as.vector(ext(v))  
x <- spin(v, 45, e[1], e[3])
```

stretch	<i>Stretch</i>
---------	----------------

Description

Linear stretch of values in a `SpatRaster` object. Provide the desired output range (`minv` and `maxv`) and the lower and upper bounds in the original data, either as quantiles (`minq` and `maxq`, or as cell values (`smin` and `smax`). If `smin` and `smax` are both not NA, `minq` and `maxq` are ignored.

Usage

```
## S4 method for signature 'SpatRaster'
stretch(x, minv=0, maxv=255, minq=0, maxq=1, smin=NA, smax=NA, filename="", ...)
```

Arguments

<code>x</code>	<code>SpatRaster</code>
<code>minv</code>	numeric ≥ 0 and smaller than <code>maxv</code> . lower bound of stretched value
<code>maxv</code>	numeric ≤ 255 and larger than <code>minv</code> . upper bound of stretched value
<code>minq</code>	numeric ≥ 0 and smaller than <code>maxq</code> . lower quantile bound of original value. Ignored if <code>smin</code> is supplied
<code>maxq</code>	numeric ≤ 1 and larger than <code>minq</code> . upper quantile bound of original value. Ignored if <code>smax</code> is supplied
<code>smin</code>	numeric $< smax$. user supplied lower value for the layers, to be used instead of a quantile computed by the function itself
<code>smax</code>	numeric $> smin$. user supplied upper value for the layers, to be used instead of a quantile computed by the function itself
<code>filename</code>	character. Output filename
<code>...</code>	additional arguments for writing files as in writeRaster

Value

`SpatRaster`

Examples

```
r <- rast(nc=10, nr=10)
values(r) <- rep(1:25, 4)
rs <- stretch(r)
s <- c(r, r*2)
sr <- stretch(s)
```

subset	<i>Subset of a SpatRaster</i>
--------	-------------------------------

Description

Select a subset of layers from a SpatRaster.

Usage

```
## S4 method for signature 'SpatRaster'
subset(x, subset, filename="", overwrite=FALSE, ...)
```

Arguments

x	SpatRaster
subset	integer or character. Should indicate the layers (represented as integer or by their names)
filename	character. Output filename
overwrite	logical. If TRUE, filename is overwritten
...	additional arguments for writing files as in writeRaster

Value

SpatRaster

Examples

```
s <- rast(system.file("ex/logo.tif", package="terra"))
subset(s, 2:3)
subset(s, c(3,2,3,1))
#equivalent to
s[[ c(3,2,3,1) ]]

s[c("red", "green")]
s$red
```

subset-vector	<i>Subset of a SpatVector</i>
---------------	-------------------------------

Description

Select a subset of variables or records from a SpatVector.

Usage

```
## S4 method for signature 'SpatVector'
subset(x, subset, drop=FALSE)
```

Arguments

x	SpatVector
subset	logical expression indicating elements or rows to keep: missing values are taken as false
drop	logical. If TRUE, the geometries will be dropped, and a data.frame is returned

Value

SpatVector or, if drop=TRUE, a data.frame.

Examples

```
f <- system.file("ex/lux.shp", package="terra")
v <- vect(f)
v[2:3,]
v[,2:3]
subset(v, v$NAME_1 == "Diekirch")
```

summarize-generics *Summarize*

Description

Compute summary statistics for cells, either across layers or between layers (parallel summary).

The following summary methods are available for SpatRaster: any, all, max, min, mean, median, prod, range, stdev, sum, w. See [modal](#) to compute the mode and [app](#) to compute summary statistics that are not included here.

Because generic functions are used, the method applied is chosen based on the first argument: "x". This means that if r is a SpatRaster, mean(r, 5) will work, but mean(5, r) will not work.

The mean method has an argument "trim" that is ignored.

The stdev method returns the population standard deviation, computed as:

```
f <-function(x) sqrt(sum((x-mean(x))^2) / length(x))
```

This is different than the sample standard deviation returned by sd (which uses n-1 as denominator).

Function f above is equivalent to function g below

```
g <-function(x) sqrt(sum((x-mean(x))^2) / length(x))
```

Usage

```
## S4 method for signature 'SpatRaster'  
min(x, ..., na.rm=FALSE)  
  
## S4 method for signature 'SpatRaster'  
max(x, ..., na.rm=FALSE)  
  
## S4 method for signature 'SpatRaster'  
range(x, ..., na.rm=FALSE)  
  
## S4 method for signature 'SpatRaster'  
mean(x, ..., trim=NA, na.rm=FALSE)  
  
## S4 method for signature 'SpatRaster'  
median(x, na.rm=FALSE)  
  
## S4 method for signature 'SpatRaster'  
stdev(x, ..., na.rm=FALSE)  
  
## S4 method for signature 'SpatRaster'  
which.min(x)  
  
## S4 method for signature 'SpatRaster'  
which.max(x)
```

Arguments

x	SpatRaster
...	additional SpatRaster objects or numeric values
trim	ignored
na.rm	logical. If TRUE, NA values are ignored. If FALSE, NA is returned if x has any NA values

Value

SpatRaster

See Also

[app](#), [Math-methods](#), [modal](#)

Examples

```
set.seed(0)  
r <- rast(nrow=10, ncol=10, nlyr=3)  
values(r) <- runif(size(r))  
  
x <- mean(r)
```

```
# note how this returns one layer
x <- sum(c(r, r[[2]], 5))

# and this returns three layers
y <- sum(r, r[[2]], 5)

max(r)
max(r, 0.5)

y <- stdev(r)
# not the same as
yy <- app(r, sd)

z <- stdev(r, r*2)
```

summary

summary

Description

Compute summary statistics (min, max, mean, and quartiles) for SpatRaster using base [summary](#) method. A sample is used for very large files.

Usage

```
## S4 method for signature 'SpatRaster'
summary(object, size=100000, warn=TRUE, ...)

## S4 method for signature 'SpatVector'
summary(object, ...)
```

Arguments

object	SpatRaster or SpatVector
size	positive integer. Size of a regular sample used for large datasets (see spatSample)
warn	logical. If TRUE a warning is given if a sample is used
...	additional arguments passed on to the base summary method

Value

matrix with (an estimate of) the median, minimum and maximum values, the first and third quartiles, and the number of cells with NA values

See Also

[global](#), [quantile](#)

Examples

```
set.seed(0)
r <- rast(nrow=10, ncol=10, nlyr=3)
values(r) <- runif(size(r))
summary(r)
```

 svc

Create a SpatVectorCollection

Description

Methods to create a SpatVectorCollection. This is an object to hold "sub-datasets", each a SpatVector, perhaps of different geometry type.

Usage

```
## S4 method for signature 'missing'
svc(x, ...)

## S4 method for signature 'SpatVector'
svc(x, ...)

## S4 method for signature 'list'
svc(x, ...)
```

Arguments

x SpatVector, or list of SpatVector objects, or missing
 ... additional arguments. Can be other SpatVector objects if x is a SpatVector

Value

SpatVectorCollection

Examples

```
f <- system.file("ex/lux.shp", package="terra")
v <- vect(f)
x <- svc()
x <- svc(v, v[1:3,], as.lines(v[3:5,]), as.points(v))
length(x)
x

# extract
x[3]

# replace
x[2] <- as.lines(v[1,])
```

symdif	<i>Symmetrical difference</i>
--------	-------------------------------

Description

Symmetrical difference of polygons

Usage

```
## S4 method for signature 'SpatVector,SpatVector'  
symdif(x, y)
```

Arguments

x	SpatVector
y	SpatVector

Value

SpatVector

See Also

[erase](#)

Examples

```
p <- vect(system.file("ex/lux.shp", package="terra"))  
b <- as.polygons(ext(6, 6.4, 49.75, 50))  
#sd <- symdif(p, b)  
#plot(sd, col=rainbow(12))
```

tapp

Apply a function to subsets of layers of a SpatRaster

Description

Apply a function to subsets of layers of a SpatRaster (similar to [tapply](#) and [aggregate](#)). The layers are combined based on the index.

The function used should return a single value, and the number of layers in the output SpatRaster equals the number of unique values in index.

For example, if you have a SpatRaster with 6 layers, you can use `index=c(1,1,1,2,2,2)` and `fun=sum`. This will return a SpatRaster with two layers. The first layer is the sum of the first three layers in the input SpatRaster, and the second layer is the sum of the last three layers in the input SpatRaster. index are recycled such that `index=c(1,2)` would also return a SpatRaster with two layers (one based on the odd layers (1,3,5), the other based on the even layers (2,4,6)).

See [app](#) or [Summary-methods](#) if you want to use a more efficient function that returns multiple layers based on **all** layers in the SpatRaster object.

Usage

```
## S4 method for signature 'SpatRaster'
tapp(x, index, fun, ..., filename="", overwrite=FALSE, wopt=list())
```

Arguments

x	SpatRaster
index	factor or numeric (integer). Vector of length <code>nlyr(x)</code> (shorter vectors are recycled) grouping the input layers
fun	function to be applied
...	additional arguments passed to fun
filename	character. Output filename
overwrite	logical. If TRUE, filename is overwritten
wopt	list with named options for writing files as in writeRaster

Value

SpatRaster

See Also

[app](#), [Summary-methods](#)

Examples

```
r <- rast(ncol=10, nrow=10)
values(r) <- 1:ncell(r)
s <- c(r, r, r, r, r, r)
s <- s * 1:6
b1 <- tapp(s, index=c(1,1,1,2,2,2), fun=sum)
b1
b2 <- tapp(s, c(1,2,3,1,2,3), fun=sum)
b2
```

terrain	<i>terrain characteristic</i>
---------	-------------------------------

Description

Compute terrain characteristic from elevation data. The elevation values should be the same as the map units (typically meter) for projected (planar) raster data. They should be in meter when the coordinate reference system (CRS) is longitude/latitude.

Usage

```
## S4 method for signature 'SpatRaster'
terrain(x, v="slope", neighbors=8, unit="degrees", filename="", ...)
```

Arguments

x	SpatRaster, single layer with elevation values. Values should have the same unit as the map units, or in meters when the crs is longitude/latitude
v	character. One or more of these options: slope, aspect, TPI, TRI, roughness, flowdir (see Details)
unit	character. "degrees" or "radians" for the output of "slope" and "aspect"
neighbors	integer. Indicating how many neighboring cells to use to compute slope or aspect with. Either 8 (queen case) or 4 (rook case)
filename	character. Output filename
...	list. Options for writing files as in writeRaster

Details

When neighbors=4, slope and aspect are computed according to Fleming and Hoffer (1979) and Ritter (1987). When neighbors=8, slope and aspect are computed according to Horn (1981). The Horn algorithm may be best for rough surfaces, and the Fleming and Hoffer algorithm may be better for smoother surfaces (Jones, 1997; Burrough and McDonnell, 1998).

If slope = 0, aspect is set to $0.5 \cdot \pi$ radians (or 90 degrees if unit="degrees"). When computing slope or aspect, the coordinate reference system of x must be known for the algorithm to differentiate between planar and longitude/latitude data.

terrain is not vectorized over "neighbors" or "unit" – only the first value is used.

flowdir returns the "flow direction" (of water), that is the direction of the greatest drop in elevation (or the smallest rise if all neighbors are higher). They are encoded as powers of 2 (0 to 7). The cell to the right of the focal cell is 1, the one below that is 2, and so on:

```

32  64  128
16   x   1
 8   4   2

```

If two cells have the same drop in elevation, a random cell is picked. That is not ideal as it may prevent the creation of connected flow networks. ArcGIS implements the approach of Greenlee (1987) and I might adopt that in the future.

The terrain indices are according to Wilson et al. (2007), as in `gdaldem`. TRI (Terrain Ruggedness Index) is the mean of the absolute differences between the value of a cell and the value of its 8 surrounding cells. TPI (Topographic Position Index) is the difference between the value of a cell and the mean value of its 8 surrounding cells. Roughness is the difference between the maximum and the minimum value of a cell and its 8 surrounding cells.

Such measures can also be computed with the `focal` function:

```

f <- matrix(1, nrow=3, ncol=3)
TRI <- focal(x, w=f, fun=function(x, ...) sum(abs(x[-5]-x[5]))/8)
TPI <- focal(x, w=f, fun=function(x, ...) x[5] - mean(x[-5]))
rough <- focal(x, w=f, fun=function(x, ...) max(x) - min(x), na.rm=TRUE)

```

text

Add labels to a map

Description

Plots labels, that is a textual (rather than color) representation of values, on top an existing plot (map).

Usage

```
## S4 method for signature 'SpatRaster'
text(x, labels, digits=0, halo=FALSE, ...)

## S4 method for signature 'SpatVector'
text(x, labels, halo=FALSE, ...)
```

Arguments

x	SpatRaster or SpatVector
labels	character. Optional. Vector of labels with length(x) or a variable name from names(x)
digits	integer. how many digits should be used?
halo	logical. If TRUE a "halo" is printed around the text. If TRUE, additional arguments hc="white" and hw=0.1 can be modified to set the colour and width of the halo
...	additional arguments to pass to graphics function text

See Also

[text](#), [plot](#)

Examples

```
r <- rast(nrows=4, ncols=4)
values(r) <- 1:ncell(r)
plot(r)
text(r)

plot(r)
text(r, halo=TRUE, hc="blue", col="white", hw=0.2)

plot(r, col=rainbow(16))
text(r, col=c("black", "white"), vfont=c("sans serif", "bold"), cex=2)
```

time

time of SpatRaster layers

Description

Get or set the time of the layers of a SpatRaster. Experimental. Currently only Date's allowed.

Usage

```
## S4 method for signature 'SpatRaster'
time(x)

## S4 replacement method for signature 'SpatRaster'
time(x)<-value
```

Arguments

x	SpatRaster
value	"Date", "POSIXt", or numeric

Value

Date

See Also[depth](#)**Examples**

```
s <- rast(system.file("ex/logo.tif", package="terra"))

time(s) <- as.Date("2001-05-04") + 0:2
time(s)
```

 tmpFiles

Temporary files

Description

List and optionally remove temporary files created by the terra package. These files are created when an output SpatRaster may be too large to store in memory (RAM). This can happen when no filename is provided to a function and when using functions where you cannot provide a filename.

Temporary files are automatically removed at the end of each R session that ends normally. You can use tmpFiles to see the files in the current sessions, including those that are orphaned (not connect to a SpatRaster object any more) and from other (perhaps old) sessions, and remove all the temporary files.

Usage

```
tmpFiles(current=TRUE, orphan=FALSE, old=FALSE, remove=FALSE)
```

Arguments

current	logical. If TRUE, temporary files from the current R session are included
orphan	logical. If TRUE, temporary files from the current R session that are no longer associated with a SpatRaster object (if current is TRUE these are also included)
old	logical. If TRUE, temporary files from other "R" sessions. Unless you are running multiple instances of R at the same time, these are from old (possibly crashed) R sessions and should be removed
remove	logical. If TRUE, temporary files are removed

Value

character

See Also

[terraOptions](#)

Examples

```
tmpFiles()
```

transpose

Transpose

Description

Transpose a SpatRaster

Usage

```
## S4 method for signature 'SpatRaster'  
t(x)
```

```
## S4 method for signature 'SpatVector'  
t(x)
```

```
## S4 method for signature 'SpatRaster'  
transpose(x, filename="", ...)
```

Arguments

x	SpatRaster
filename	character. Output filename
...	additional arguments for writing files as in writeRaster

Value

SpatRaster

See Also

[flip](#), [rotate](#)

Examples

```
r <- rast(nrow=18, ncol=36)
values(r) <- 1:ncell(r)
tr1 <- t(r)
tr2 <- transpose(r)
ttr <- transpose(tr2)
```

trim

Trim a SpatRaster

Description

Trim (shrink) a SpatRaster by removing outer rows and columns that are NA.

Usage

```
## S4 method for signature 'SpatRaster'
trim(x, padding=0, filename="", ...)
```

Arguments

x	SpatRaster
padding	integer. Number of outer rows/columns to keep
filename	character. Output filename
...	additional arguments for writing files as in writeRaster

Value

SpatRaster

Examples

```
r <- rast(ncol=10, nrow=10, xmin=0, xmax=10, ymin=0, ymax=10)
v <- rep(NA, ncell(r))
v[c(12,34,69)] <- 1:3
values(r) <- v
s <- trim(r)
```

union	<i>Union SpatVector or SpatExtent objects</i>
-------	---

Description

Overlapping polygons (between, not within, objects) are intersected. Union for lines and points simply combines the two data sets; without any geometric intersections. This is equivalent to [c](#). Attributes are joined. See [c](#) if you want to combine polygons without intersection.

If `codex` and `y` have a different geometry type, a `SpatVectorCollection` is returned.

If a single `SpatVector` is supplied, overlapping polygons are intersected. Original attributes are lost. New attributes allow for determining how many, and which, polygons overlapped.

`SpatExtent`: Objects are combined into their union; this is equivalent to `+`.

Usage

```
## S4 method for signature 'SpatVector,SpatVector'  
union(x, y)
```

```
## S4 method for signature 'SpatVector,missing'  
union(x, y)
```

```
## S4 method for signature 'SpatExtent,SpatExtent'  
union(x, y)
```

Arguments

<code>x</code>	<code>SpatVector</code> or <code>SpatExtent</code>
<code>y</code>	Same as <code>x</code> or missing

Value

`SpatVector` or `SpatExtent`

See Also

[intersect](#))

[merge](#) and [mosaic](#) to union `SpatRaster` objects.

[crop](#) and [expand](#) for the union of `SpatRaster` and `SpatExtent`.

[merge](#) for merging a `data.frame` with attributes of a `SpatVector`.

Examples

```

e1 <- ext(-10, 10, -20, 20)
e2 <- ext(0, 20, -40, 5)
union(e1, e2)

#SpatVector
v <- vect(system.file("ex/lux.shp", package="terra"))
v <- v[,3:4]
p <- vect(c("POLYGON ((5.8 49.8, 6 49.9, 6.15 49.8, 6 49.65, 5.8 49.8))",
"POLYGON ((6.3 49.9, 6.2 49.7, 6.3 49.6, 6.5 49.8, 6.3 49.9))"), crs=crs(v))
values(p) <- data.frame(pid=1:2, value=area(p))
#u <- union(v, p)
#plot(u, "pid")

#b <- buffer(v, .015)
#u <- union(b)
#u$sum <- rowSums(as.data.frame(u))
#plot(u, "sum")

```

unique

Unique values

Description

This function returns the unique values in a SpatRaster.

Usage

```

## S4 method for signature 'SpatRaster'
unique(x, incomparables=FALSE)

## S4 method for signature 'SpatVector'
unique(x, incomparables=FALSE, ...)

```

Arguments

x	SpatRaster or SpatVector
incomparables	logical. If FALSE and x is a SpatRaster: the unique values are determined for all layers together, and the result is a matrix. If TRUE, each layer is evaluated separately, and a list is returned. If x is a SpatVector this argument is as for a data.frame
...	additional arguments passed on to base::unique

Value

If x is a SpatRaster: vector or matrix

If x is a SpatVector: SpatVector

Examples

```

r <- rast(ncol=5, nrow=5)
values(r) <- rep(1:5, each=5)
unique(r)
s <- c(r, round(r/3))
unique(s)
unique(s,TRUE)

v <- vect(cbind(x=c(1:5,1:5), y=c(5:1,5:1)),
crs="+proj=utm +zone=1 +datum=WGS84")
nrow(v)
u <- unique(v)
nrow(u)

```

units

units of SpatRaster or SpatRasterDataSet

Description

Get or set the units of the layers of a SpatRaster or the datasets in a SpatRasterDataSet.

Usage

```

## S4 method for signature 'SpatRaster'
units(x)

## S4 replacement method for signature 'SpatRaster'
units(x)<-value

## S4 method for signature 'SpatRasterDataset'
units(x)

## S4 replacement method for signature 'SpatRasterDataset'
units(x)<-value

```

Arguments

x	SpatRaster
value	character

Value

character

See Also

[time, names](#)

Examples

```
s <- rast(system.file("ex/logo.tif", package="terra"))

units(s) <- c("m/s", "kg", "ha")
units(s)
s

units(s) <- "kg"
units(s)
```

values

Get or set cell values

Description

values returns all cell values of a SpatRaster (a matrix), or all the attributes of a SpatVector (a data.frame).

Usage

```
## S4 method for signature 'SpatRaster'
values(x, mat=TRUE, dataframe=FALSE, row=1, nrow=nrow(x), col=1, ncol=ncol(x))

## S4 replacement method for signature 'SpatRaster,ANY'
values(x)<-value

## S4 method for signature 'SpatRaster,ANY'
setValues(x, values)

## S4 method for signature 'SpatVector'
values(x)

## S4 replacement method for signature 'SpatVector,data.frame'
values(x)<-value
```

Arguments

x	SpatRaster or SpatVector
mat	logical. If TRUE, values are returned as a matrix instead of as a vector, except when dataframe is TRUE
dataframe	logical. If TRUE, values are returned as a data.frame instead of as a vector (also if matrix is TRUE)
row	positive integer. Row number to start from, should be between 1 and nrow(x)
nrow	positive integer. How many rows?
col	positive integer. Column number to start from, should be between 1 and ncol(x)

<code>ncols</code>	positive integer. How many columns? Default is the number of columns left after the start column
<code>value</code>	For <code>SpatRaster</code> : matrix or numeric, the length must match the total number of cells (<code>ncell(x) * nlyr(x)</code>), or be a single value. For <code>SpatVector</code> : <code>data.frame</code> or <code>NULL</code>
<code>values</code>	Same as for <code>value</code>

Details

If `x` is a `SpatRaster`:

If `matrix=TRUE`, a matrix is returned in which the values of each layer are represented by a column (with `ncell(x)` rows). The values per layer are in cell-order, that is, from top-left, to top-right and then down by row. Use `as.matrix` for an alternative matrix representation where the number of rows and columns matches that of `x`, if `x` has a single layer. If `matrix=FALSE`, the values are returned as a vector. In cell-order by layer.

If `x` is a `SpatVector`: a `data.frame`

Value

matrix, vector, `SpatRaster`, or nothing

Examples

```
r <- rast(system.file("ex/test.tif", package="terra"))
r
v <- values(r)
values(r) <- v * 10
r

f <- system.file("ex/lux.shp", package="terra")
v <- vect(f)
x <- values(v)
x
values(v) <- x[,1:2]
v
```

vect

Create SpatVector objects

Description

Create a new `SpatVector`

Usage

```
## S4 method for signature 'character'
vect(x, ...)

## S4 method for signature 'matrix'
vect(x, type="points", atts=NULL, crs="", ...)

## S4 method for signature 'data.frame'
vect(x, geom=c("lon", "lat"), crs="", ...)

## S4 method for signature 'sf'
vect(x)
```

Arguments

x	character (filename or "Well Known Text"); or a data.frame or matrix with geometry data (see geom ; or missing; or a vector object from sf or sp
type	character. Geometry type. Must be "points", "lines", or "polygons"
atts	data.frame with the attributes. The number of rows must match the number of geometrical elements
crs	the coordinate reference system (PROJ4 notation)
geom	the field name(s) with the geometry data. Either two names for x and y coordinates of points, or a single name for a single column with WKT geometries)
...	additional matrices and/or lists with matrices

Value

SpatVector

See Also

```

vector-attributes

Get or replace attribute values of a SpatVector

Description

Replace values of a SpatVector.

Usage

```

## S4 method for signature 'SpatVector'
x$name

## S4 replacement method for signature 'SpatVector'
x$name<-value

```

Arguments

x	SpatVector
name	character
value	vector

Value

vector

See Also

[values](#)

Examples

```
f <- system.file("ex/lux.shp", package="terra")
v <- vect(f)
v$NAME_1
v$ID_1 <- LETTERS[1:12]
v$new <- sample(12)
values(v)
```

voronoi

voronoi diagram and delauny triangles

Description

Get a voronoi diagram or delauny triangles for points, or nodes of lines or polygons

Usage

```
## S4 method for signature 'SpatVector'
voronoi(x, bnd=NULL, tolerance=0, as.lines=FALSE)
```

```
## S4 method for signature 'SpatVector'
delauny(x, tolerance=0, as.lines=FALSE)
```

Arguments

x	SpatVector
bnd	SpatVector to set the outer boundary of the voronoi diagram
tolerance	numeric ≥ 0 , snapping tolerance (0 is no snapping)
as.lines	logical. If TRUE, lines are returned without the outer boundary

Value

SpatVector

Examples

```
wkt <- c("MULTIPOLYGON ( ((40 40, 20 45, 45 30, 40 40)),
  ((20 35, 10 30, 10 10, 30 5, 45 20, 20 35),(30 20, 20 15, 20 25, 30 20)))",
  "POLYGON ((0 -5, 10 0, 10 -10, 0 -5))")
x <- vect(wkt)
v <- voronoi(x)
v

plot(v, lwd=2, col=rainbow(15))
lines(x, col="gray", lwd=2)
points(x)
```

window

Set a window

Description

Experimental: Assign a window (area of interest) to a `SpatRaster` with a `SpatExtent`, or set it to `NULL` to remove the window. This is similar to `crop` without actually creating a new dataset.

Currently, the window will be forced to intersect with the extent of the `SpatRaster`. It is envisioned that in future versions, the window may also go outside these boundaries.

Usage

```
## S4 replacement method for signature 'SpatRaster'
window(x)<-value

## S4 method for signature 'SpatRaster'
window(x)
```

Arguments

x	SpatRaster
value	SpatExtent

Value

none for `window<-` and logical for `window`

See Also

[crop](#), [extend](#)

Examples

```
f <- system.file("ex/test.tif", package="terra")
r <- rast(f)
global(r, "mean", na.rm=TRUE)
e <- ext(c(179680, 180176, 331905, 332304))

window(r) <- e
global(r, "mean", na.rm=TRUE)
r

x <- rast(f)
xe <- crop(x, e)
global(xe, "mean", na.rm=TRUE)

b <- c(xe, r)
window(b)
b

window(r) <- NULL
r
```

writeCDF

Write raster data to a NetCDF file

Description

Write a `SpatRaster` or `SpatRasterDataset` to a NetCDF file.

When using a `SpatRasterDataset`, the `varname`, `longname`, and `unit` should be set in the object (see examples).

Always use the ".nc" or ".cdf" file extension to assure that the file can be properly read again by GDAL

Usage

```
## S4 method for signature 'SpatRaster'
writeCDF(x, filename, varname, longname="", unit="", ...)

## S4 method for signature 'SpatRasterDataset'
writeCDF(x, filename, overwrite=FALSE, zname="time",
         missval=-9999, prec="float", compression=NA, ...)
```

Arguments

<code>x</code>	<code>SpatRaster</code> or <code>SpatRasterDataset</code>
<code>filename</code>	character. Output filename
<code>varname</code>	character. Name of the dataset

longname	character. Long name of the dataset
unit	character. Unit of the data
overwrite	logical. If TRUE, filename is overwritten
zname	character. The name of the "time" dimension
missval	numeric, the number used to indicate missing values
prec	character. One of "double", "float", "integer", "short", "byte" or "char"
compression	Can be set to an integer between 1 (least compression) and 9 (most compression)
...	additional arguments passed on to ncvar_def

Value

SpatRaster or SpatDataSet

See Also

see [writeRaster](#) for writing other file formats

Examples

```
f <- system.file("ex/elev.tif", package="terra")
r <- rast(f)
fname <- paste0(tempfile(), ".nc")
rr <- writeCDF(r, fname, overwrite=TRUE, varname="alt",
              longname="elevation in m above sea level", unit="m")

a <- rast(ncol=5, nrow=5, nl=50)
values(a) <- 1:prod(dim(a))
time(a) <- as.Date("2020-12-31") + 1:nlyr(a)
aa <- writeCDF(a, fname, overwrite=TRUE, varname="power",
              longname="my nice data", unit="U/Pa")

b <- sqrt(a)
s <- sds(a, b)
names(s) <- c("temp", "prec")
longnames(s) <- c("temperature (C)", "precipitation (mm)")
units(s) <- c("C", "mm")
ss <- writeCDF(s, fname, overwrite=TRUE)

# for CRAN
file.remove(fname)
```

writeRaster *Write raster data to a file*

Description

Write a SpatRaster object to a file.

Usage

```
## S4 method for signature 'SpatRaster,character'
writeRaster(x, filename, overwrite=FALSE, ...)
```

Arguments

x	SpatRaster
filename	character. Output filename
overwrite	logical. If TRUE, filename is overwritten
...	additional arguments for for writing files. See Details

Details

In writeRaster, and in other methods that generate SpatRaster objects, options for writing raster files to disk can be provided as additional arguments or, in a few cases, as the wopt argument (a named list) if the additional arguments are already used for a different purpose. The following options are available:

name	description
datatype	values for datatype are "INT1U", "INT2U", "INT2S", "INT4U", "INT4S", "FLT4S", "FLT8S". The first three le
filetype	file format expresses as GDAL driver names . If this argument is not supplied, the driver is derived from the filena
gdal	GDAL driver specific datasource creation options. See the GDAL documentation. For example, with the GeoTiff
tempdir	the path where temporary files are to be written to.
progress	postive integer. If the number of chunks is larger, a progress bar is shown.
memfrac	numeric between 0.1 and 0.9. The fraction of available RAM that terra is allowed to use.
names	output layer names.
NAflag	numeric. value to represent missing (NA or NaN) values. See note
verbose	logical. If TRUE debugging information is printed.
todisk	logical. If TRUE processing operates as if the dataset is very large and needs to be written to a temporary file (for c

Value

SpatRaster. This function is used for the side-effect of writing values to a file.

Note

When writing integer values the lowest available value (given the datatype) is used for signed types, and the highest value is used for unsigned values. This can be a problem with byte data (between 0

and 255) as the value 255 is reserved for NA. To keep the value 255 use another value as NAflag, or do not set a NAflag (with NAflag=NA)

See Also

see [writeCDF](#) for writing NetCDF files.

Examples

```
library(terra)
r <- rast(nrow=5, ncol=5, vals=1:25)

# create a temporary filename for the example
f <- file.path(tempdir(), "test.tif")

writeRaster(r, f, overwrite=TRUE)

writeRaster(r, f, overwrite=TRUE, gdal=c("COMPRESS=LZW", "TFW=YES", "of=COG"), datatype='INT1U')

## Or with a wopt argument:

writeRaster(r, f, overwrite=TRUE, wopt= list(gdal=c("COMPRESS=LZW", "of=COG"), datatype='INT1U'))

## remove the file
unlink(f)
```

writeVector	<i>Write vector data to a file</i>
-------------	------------------------------------

Description

Write a SpatVector object to a file.

Usage

```
## S4 method for signature 'SpatVector,character'
writeVector(x, filename, overwrite=FALSE, ...)
```

Arguments

x	SpatVector
filename	character. Output filename
overwrite	logical. If TRUE, filename is overwritten
...	additional arguments. None implemented

Value

SpatVector (invisibly). This function is used for the side-effect of writing values to a file.

Examples

```
v <- vect(cbind(1:5,1:5))
crs(v) <- "+proj=longlat +datum=WGS84"
v$id <- 1:length(v)
v$name <- letters[1:length(v)]
tmpf1 <- tempfile()
writeVector(v, tmpf1)
x <- vect(tmpf1)

f <- system.file("ex/lux.shp", package="terra")
v <- vect(f)
tmpf2 <- tempfile()
writeVector(v, tmpf2)
y <- vect(tmpf2)
```

xmin

Get or set single values of an extent

Description

Get or set single values of an extent. Values can be set for a SpatExtent or SpatRaster, but not for a SpatVector)

Usage

```
## S4 method for signature 'SpatExtent'
xmin(x)

## S4 method for signature 'SpatExtent'
xmax(x)

## S4 method for signature 'SpatExtent'
ymin(x)

## S4 method for signature 'SpatExtent'
ymax(x)

## S4 method for signature 'SpatRaster'
xmin(x)

## S4 method for signature 'SpatRaster'
xmax(x)

## S4 method for signature 'SpatRaster'
```

```
ymin(x)

## S4 method for signature 'SpatRaster'
ymax(x)

## S4 method for signature 'SpatVector'
xmin(x)

## S4 method for signature 'SpatVector'
xmax(x)

## S4 method for signature 'SpatVector'
ymin(x)

## S4 method for signature 'SpatVector'
ymax(x)

## S4 replacement method for signature 'SpatRaster,numeric'
xmin(x)<-value

## S4 replacement method for signature 'SpatRaster,numeric'
xmax(x)<-value

## S4 replacement method for signature 'SpatRaster,numeric'
ymin(x)<-value

## S4 replacement method for signature 'SpatRaster,numeric'
ymax(x)<-value
```

Arguments

x	SpatRaster, SpatExtent, or SpatVector
value	numeric

Value

SpatExtent or numeric coordinate

Examples

```
r <- rast()
ext(r)
ext(c(0, 20, 0, 20))

xmin(r)
xmin(r) <- 0
xmin(r)
```

`xyRowColCell`*Coordinates from a row, column or cell number and vice versa*

Description

Get coordinates of the center of raster cells for a row, column, or cell number of a `SpatRaster` object. Or get row, column, or cell numbers from coordinates or from each other.

Cell numbers start at 1 in the upper left corner, and increase from left to right, and then from top to bottom. The last cell number equals the number of cells of the `SpatRaster` object. row numbers start at 1 at the top, column numbers start at 1 at the left.

Usage

```
## S4 method for signature 'SpatRaster,numeric'  
xFromCol(object, col)  
  
## S4 method for signature 'SpatRaster,numeric'  
yFromRow(object, row)  
  
## S4 method for signature 'SpatRaster,numeric'  
xyFromCell(object, cell)  
  
## S4 method for signature 'SpatRaster,numeric'  
xFromCell(object, cell)  
  
## S4 method for signature 'SpatRaster,numeric'  
yFromCell(object, cell)  
  
## S4 method for signature 'SpatRaster,numeric'  
colFromX(object, x)  
  
## S4 method for signature 'SpatRaster,numeric'  
rowFromY(object, y)  
  
## S4 method for signature 'SpatRaster,numeric,numeric'  
cellFromRowCol(object, row, col)  
  
## S4 method for signature 'SpatRaster,numeric,numeric'  
cellFromRowColCombine(object, row, col)  
  
## S4 method for signature 'SpatRaster,numeric'  
rowFromCell(object, cell)  
  
## S4 method for signature 'SpatRaster,numeric'  
colFromCell(object, cell)
```

```
## S4 method for signature 'SpatRaster,numeric'
rowColFromCell(object, cell)
```

```
## S4 method for signature 'SpatRaster,matrix'
cellFromXY(object, xy)
```

Arguments

object	SpatRaster
cell	integer. cell number(s)
col	integer. column number(s)
row	integer row number(s)
x	x coordinate(s)
y	y coordinate(s)
xy	matrix of x and y coordinates

Details

Cell numbers start at 1 in the upper left corner, and increase from left to right, and then from top to bottom. The last cell number equals the number of cells of the SpatRaster (see [ncell](#)).

Value

xFromCol, yFromCol, xFromCell, yFromCell: vector of x or y coordinates

xyFromCell: matrix(x,y) with coordinate pairs

colFromX, rowFromY, cellFromXY, cellFromRowCol, rowFromCell, colFromCell: vector of row, column, or cell numbers

rowColFromCell: matrix of row and column numbers

Examples

```
r <- rast()

xFromCol(r, c(1, 120, 180))
yFromRow(r, 90)
xyFromCell(r, 10000)
xyFromCell(r, c(0, 1, 32581, ncell(r), ncell(r)+1))

cellFromRowCol(r, 5, 5)
cellFromRowCol(r, 1:2, 1:2)
cellFromRowCol(r, 1, 1:3)

# all combinations
cellFromRowColCombine(r, 1:2, 1:2)

colFromX(r, 10)
rowFromY(r, 10)
cellFromXY(r, cbind(c(10,5), c(15, 88)))
```

zonal	<i>Zonal statistics</i>
-------	-------------------------

Description

Compute zonal statistics, that is summarized values of a `SpatRaster` for each "zone" defined by another `SpatRaster`.

If `fun` is a true function, `zonal` may fail for very large `SpatRaster` objects, except for the functions ("mean", "min", "max", or "sum").

Usage

```
## S4 method for signature 'SpatRaster,SpatRaster'
zonal(x, z, fun=mean, ...)
```

Arguments

<code>x</code>	<code>SpatRaster</code>
<code>z</code>	<code>SpatRaster</code> with values representing zones
<code>fun</code>	function to be applied to summarize the values by zone. Either as character: "mean", "min", "max", "sum", or, for relatively small <code>SpatRasters</code> , a proper function
<code>...</code>	additional arguments passed to <code>fun</code>

Value

A data.frame with a value for each zone (unique value in zones)

See Also

See [global](#) for "global" statistics (i.e., all of `x` is considered a single zone), [app](#) for local statistics, and [extract](#) for summarizing values for polygons

Examples

```
r <- rast(ncols=10, nrows=10)
values(r) <- 1:ncell(r)
z <- rast(r)
values(z) <- rep(1:4, each=25)
zonal(r, z, "sum", na.rm=TRUE)

# multiple layers
r <- rast(system.file("ex/logo.tif", package = "terra"))
# zonal layer
z <- rast(r, 1)
values(z) <- rep(1:4, each=ncell(r)/4, len=ncell(r))
zonal(r, z, "mean", na.rm = TRUE)
```

`zoom`*Zoom in on a map*

Description

Zoom in on a map (plot) by providing a new extent, by default this is done by clicking twice on the map.

Usage

```
## S4 method for signature 'SpatRaster'  
zoom(x, e=draw(), maxcell=10000, layer=1, new=FALSE, ...)  
  
## S4 method for signature 'SpatVector'  
zoom(x, e=draw(), new=FALSE, ...)
```

Arguments

<code>x</code>	<code>SpatRaster</code>
<code>e</code>	<code>SpatExtent</code>
<code>maxcell</code>	positive integer. Maximum number of cells used for the map
<code>layer</code>	positive integer to select the layer to be used
<code>new</code>	logical. If TRUE, the zoomed in map will appear on a new device (window)
<code>...</code>	additional arguments passed to plot

Value

`SpatExtent` (invisibly)
